Worldwide Causes of Death

Which input of infectious diseases
in a daily practice for a pathology laboratory?

**Different scenarii for different challenges for a
surgical pathologist!**

The first scenario.....

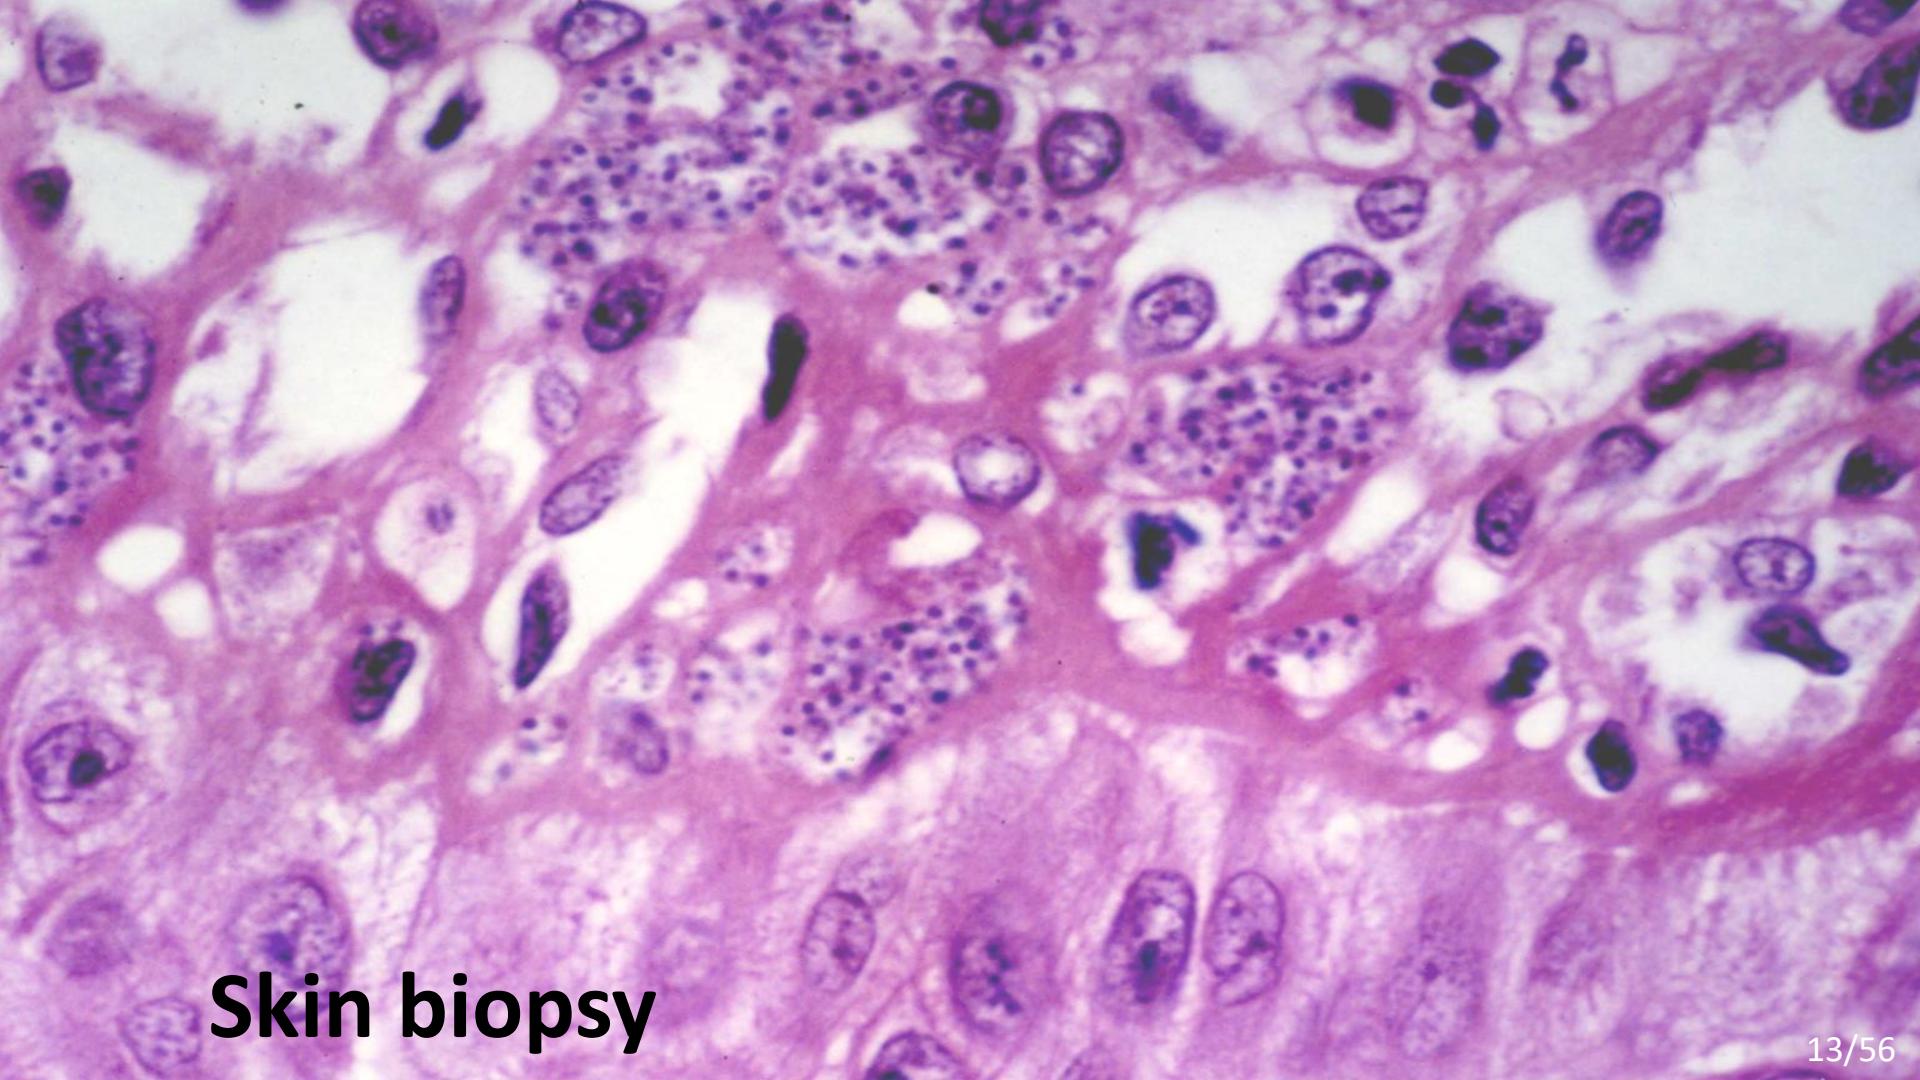

An easy diagnosis for a surgical (clinical) pathologist working in any countries....

Ten years old girl
Living in Nice
Ulcerated skin lesion of the cheek
Three months duration

Skin biopsy

What is your diagnosis ?

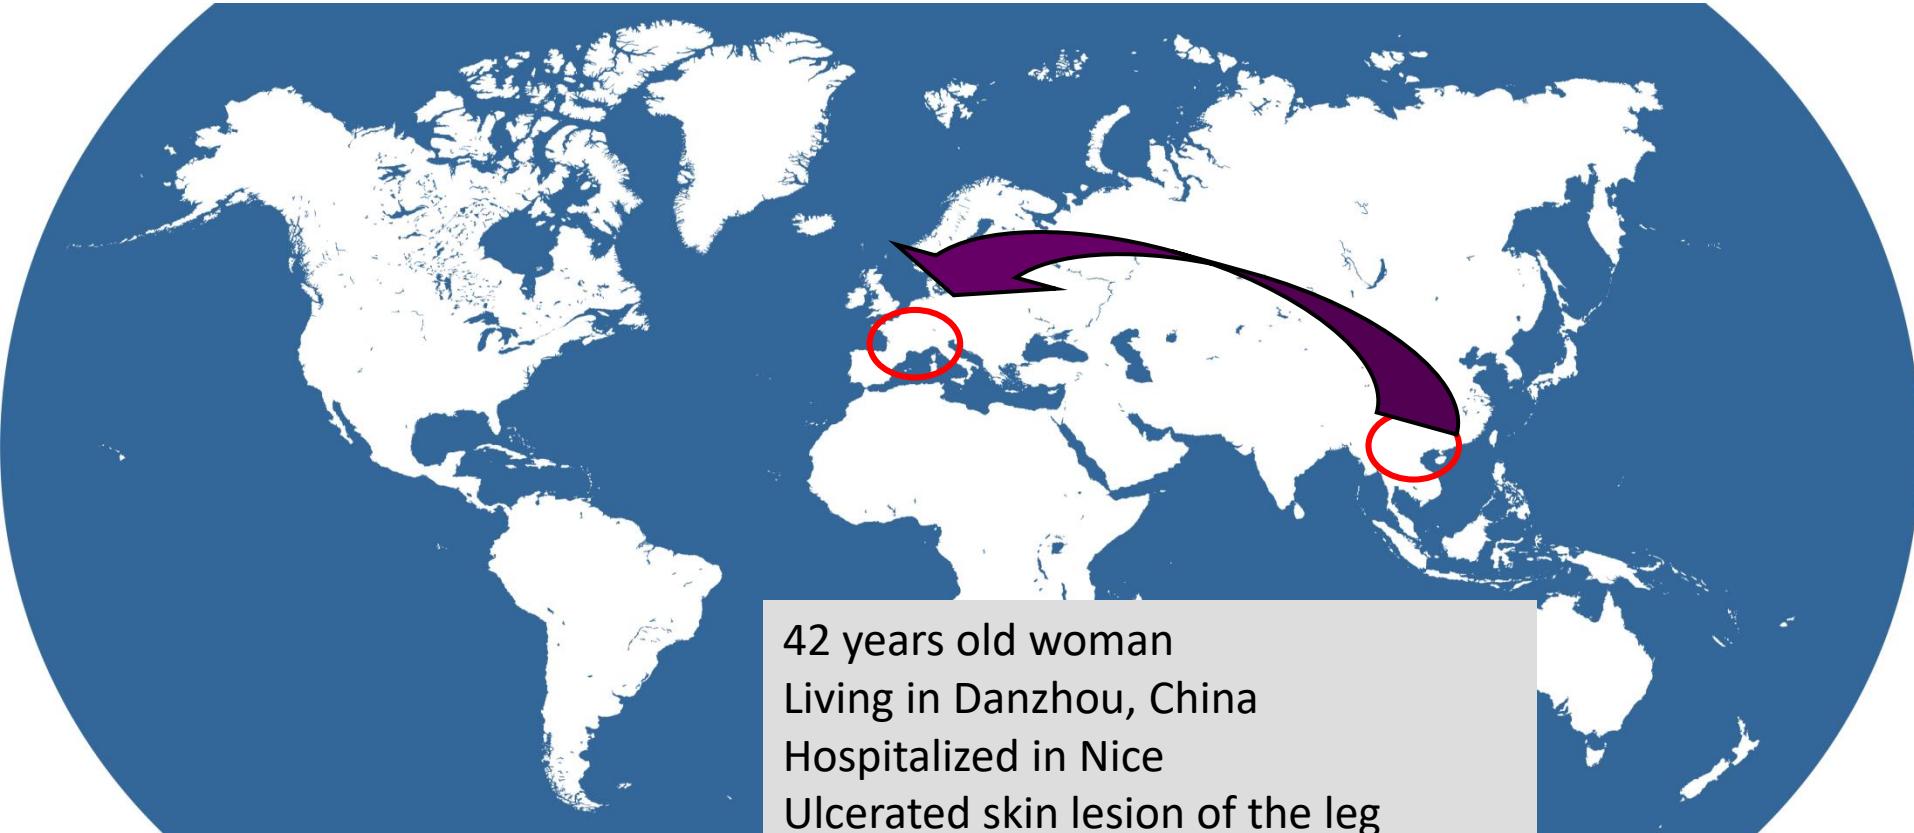

Cutaneous leishmaniasis

(caused by *Leishmania infantum*)

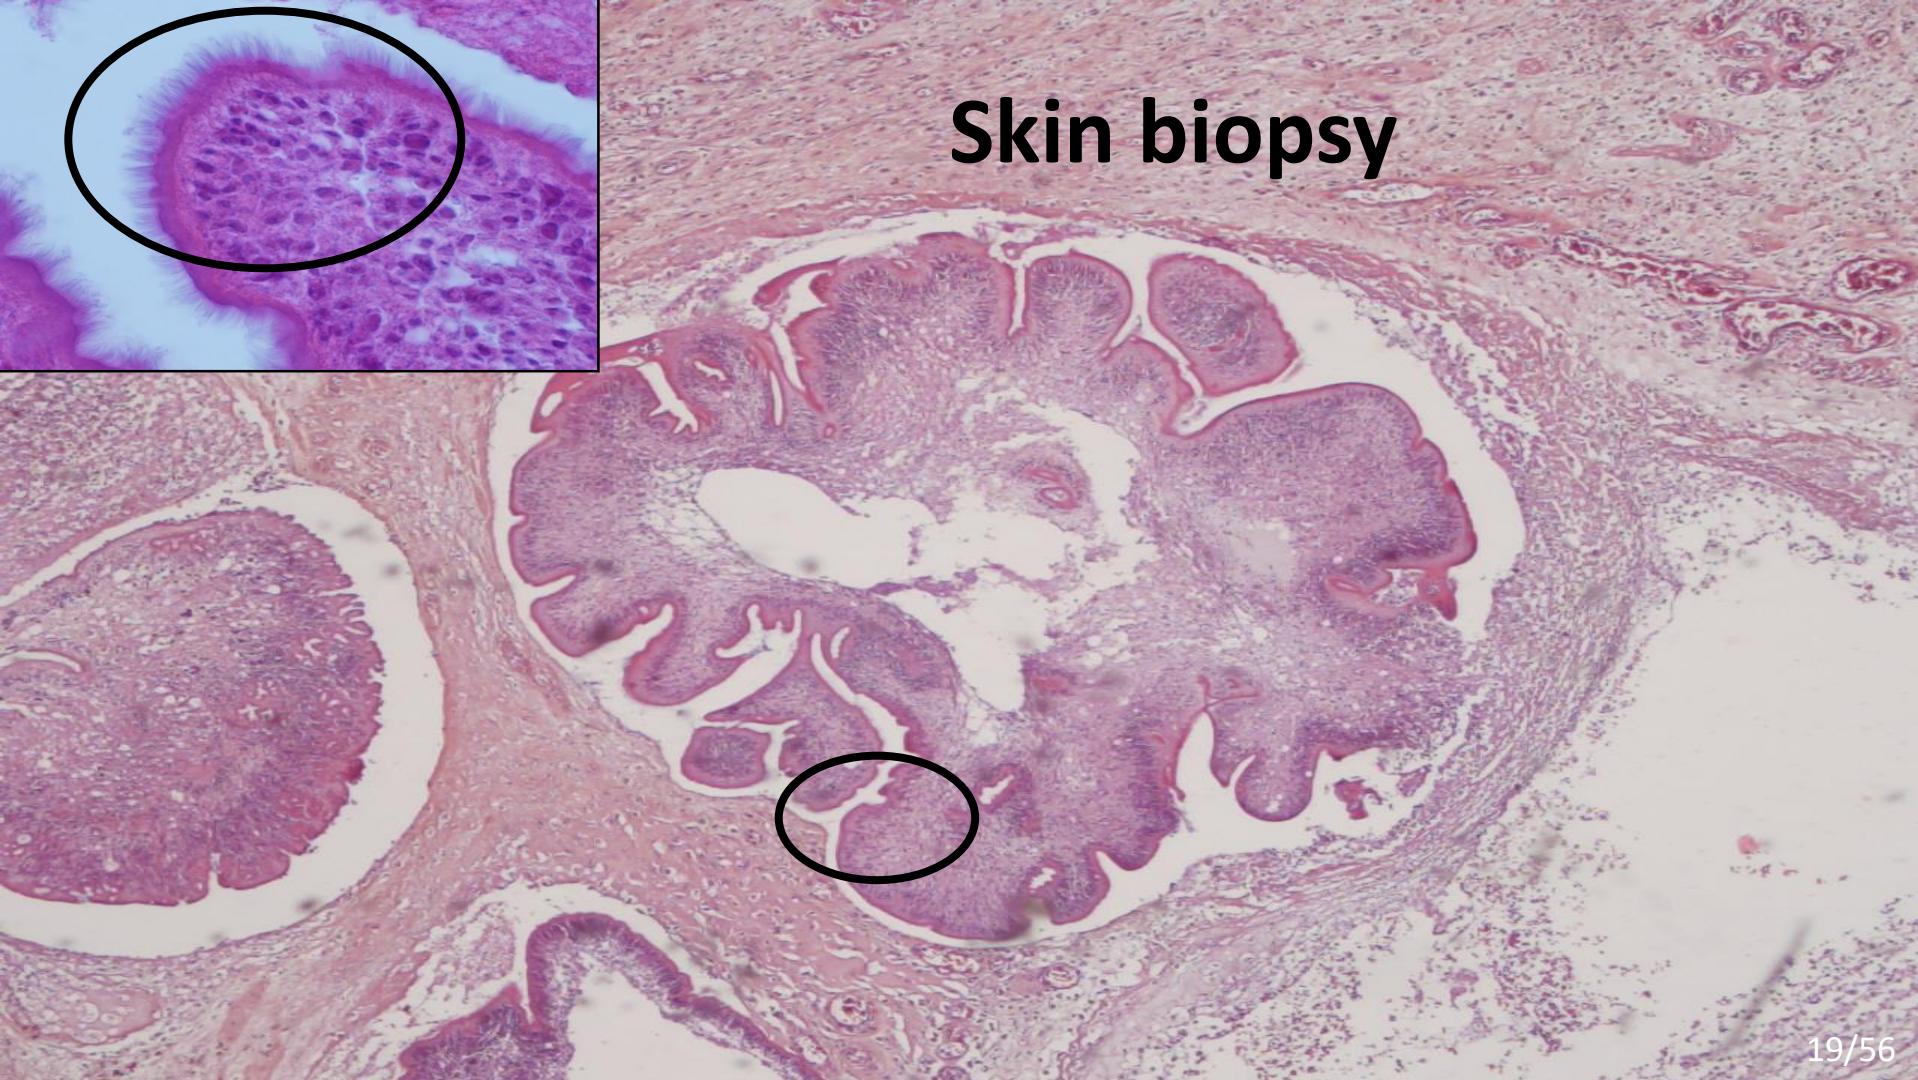

Another scenario.....

**A more complex diagnosis for a surgical
(clinical) pathologist working in Europe....**

Skin biopsy

What is your diagnosis ?

Cutaneous sparganosis (caused by *Sparganum proliferum*)

Asiatic food market

A very rare parasitic disease (cestode) of the skin

Another scenario.....

**A more complex diagnosis for a surgical pathologist working in Europe....
Is it a difficult diagnosis... ornot ?**

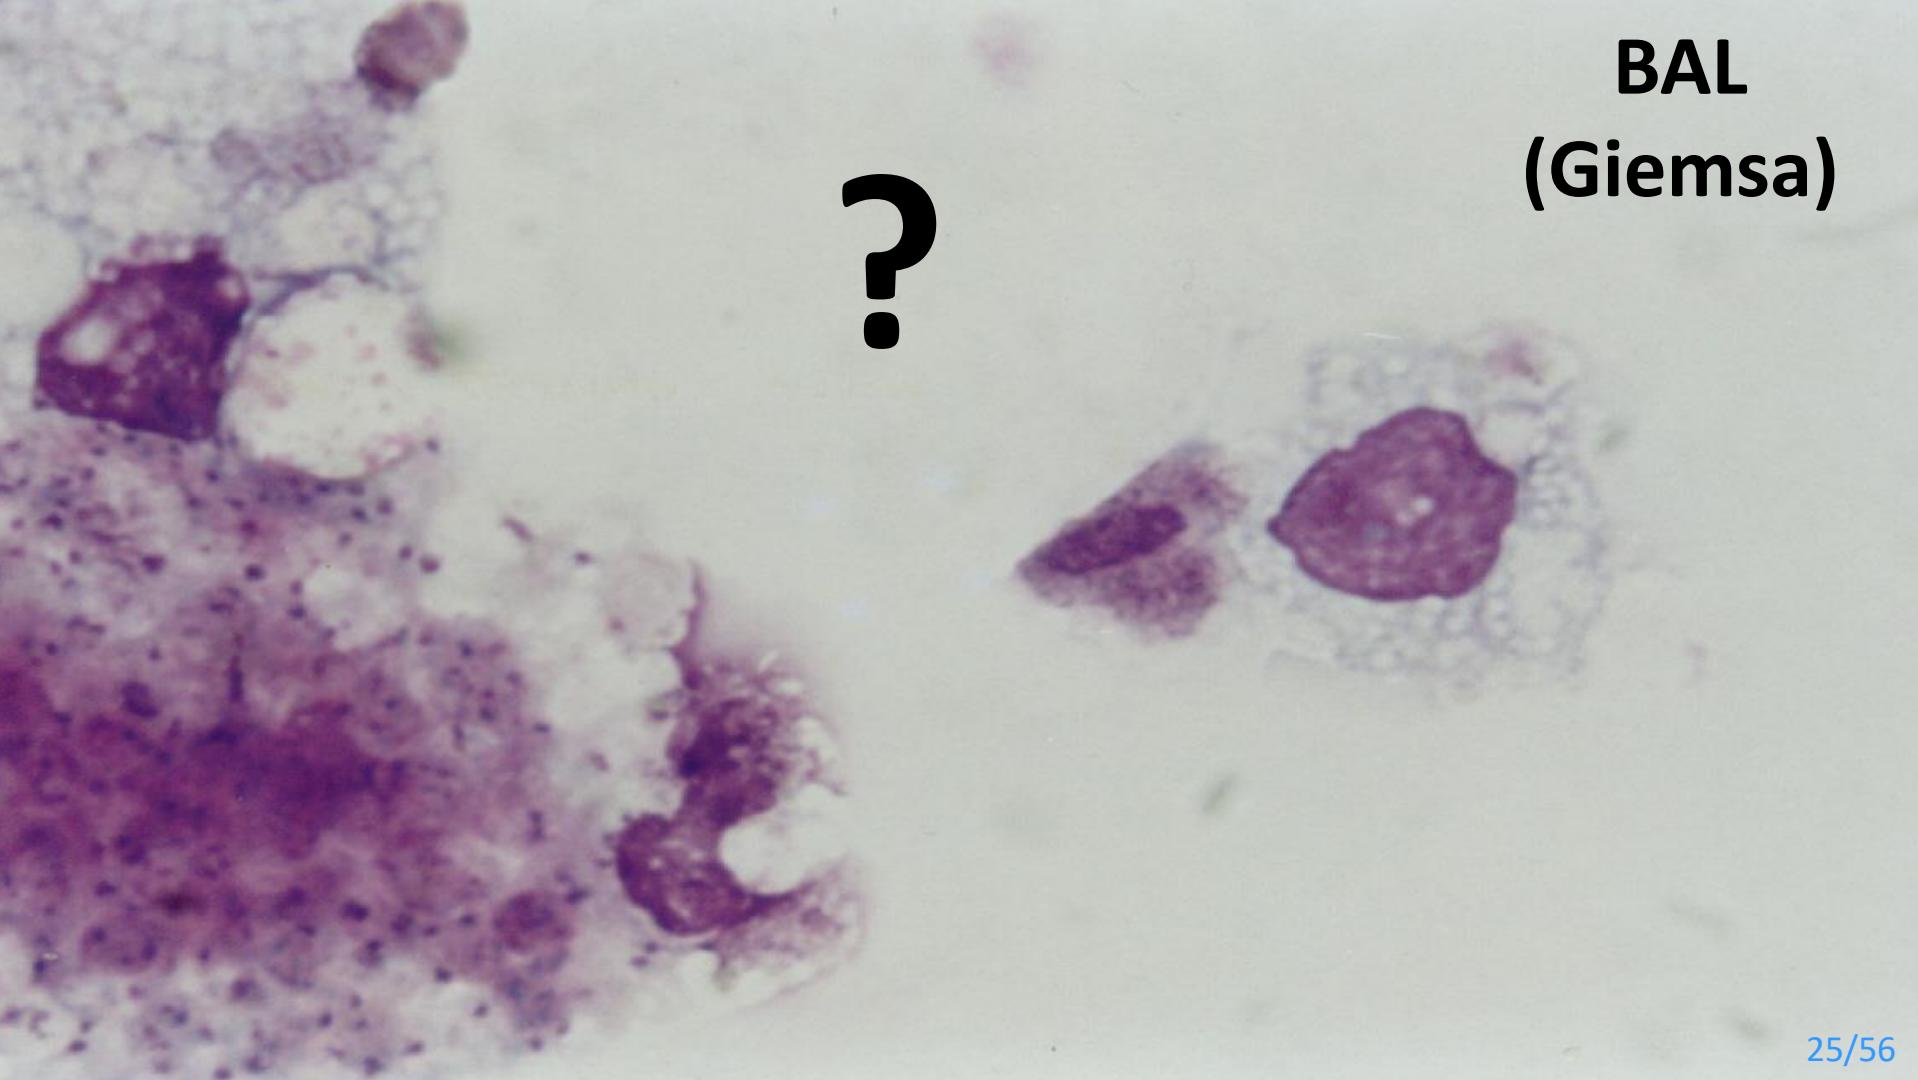

36 years old man, HIV +
Living in Nice,
Fever, polypnea

BAL
(Giemsa)

?

What is your diagnosis ?

Trichomonas tenax

Pneumocystis jirovecii

Opportunities in infectious diseases pathology practice

Increase in **opportunistic infections** following the increasing transplantation, chemotherapy and targeted therapy rates

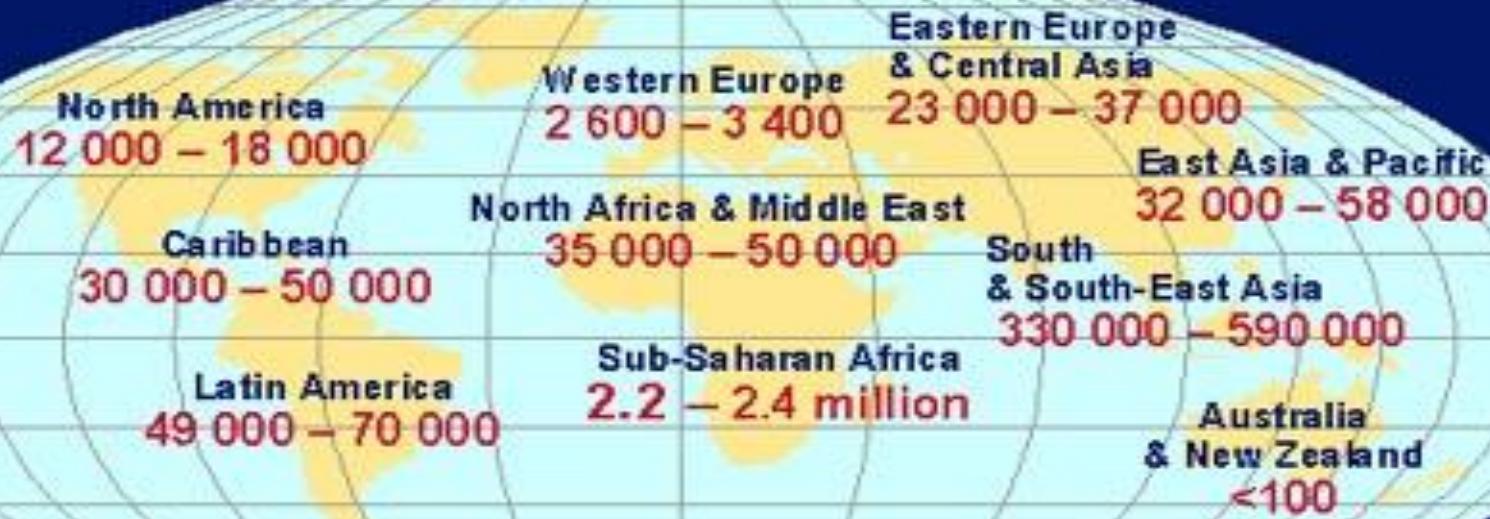

Increase in **imported parasitic and tropical diseases** in travellers and in immigrants

Emerging complications of HIV associated diseases caused by HAART

Epidemics of new and emerging or re **emerging infectious diseases**

Optimisation of **new ancillary methods** to detect pathogens in fixed samples

Opportunity to observe **tissue lesions associated with the agent** synonymous to pathogenicity and infection!

Total: 2.5 – 3.5 million

AIDS Deaths

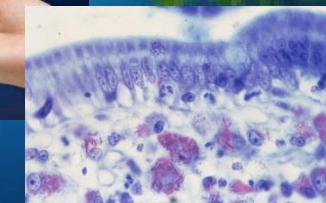

HAART and HIV

A large panel of (new) pathological induced lesions

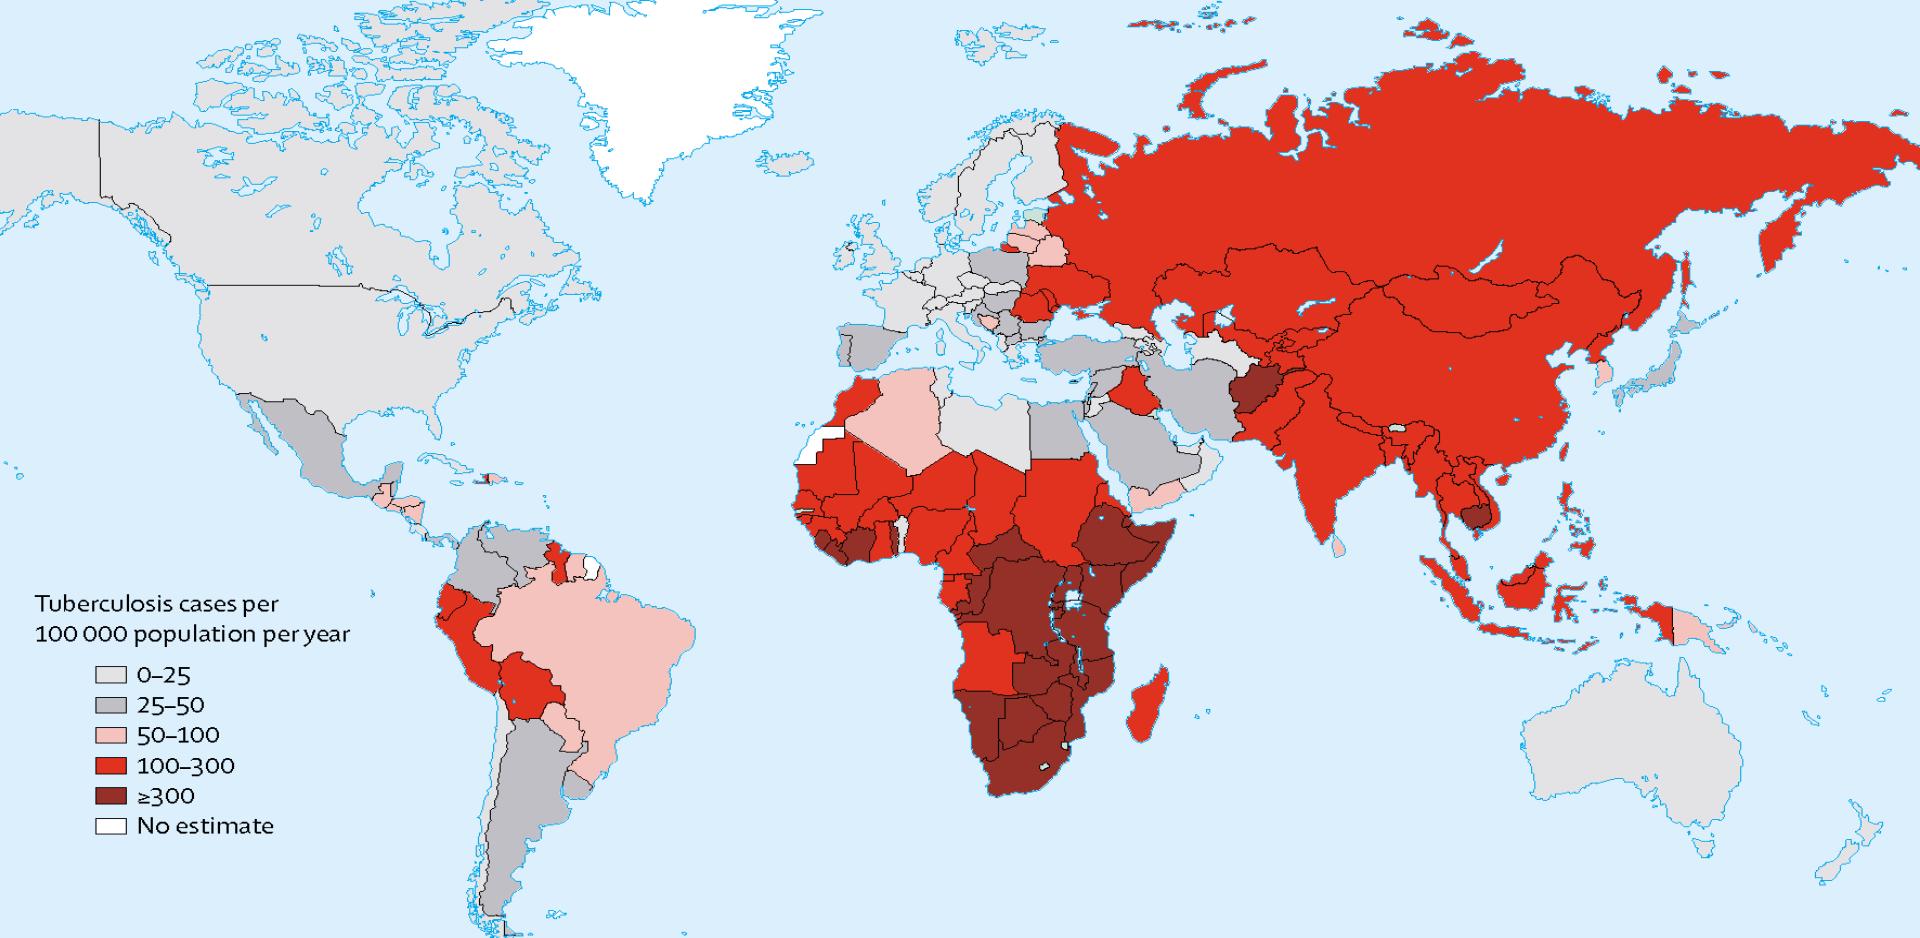

Dystrophies

Toxicities

IRIS

Tuberculosis: 1, 500.000 deaths per year

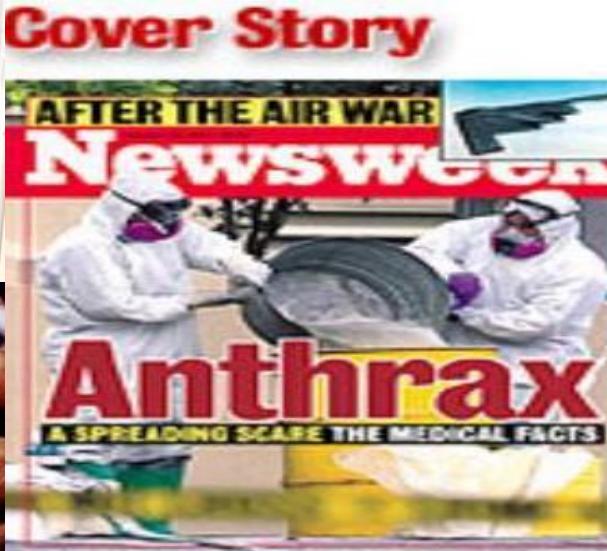

« Infectious diseases are our faithful companions throughout life »

A large, white, snow-capped mountain is shown floating in a vast, blue ocean. The mountain is mostly submerged, with only its peak and a small portion of its side visible above the water's surface. The ocean has some white foam at the base of the mountain.

Emerging and re emerging infectious diseases

Emerging infectious diseases (1991-1993)

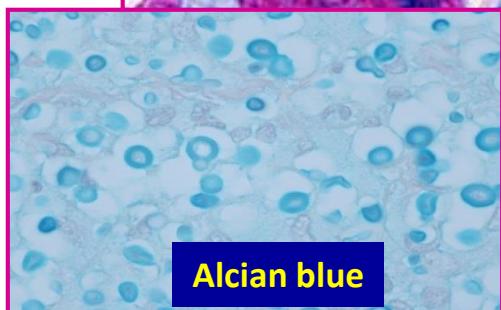

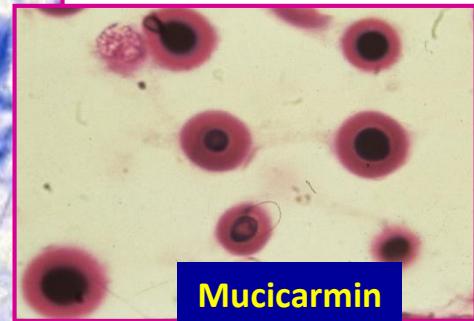

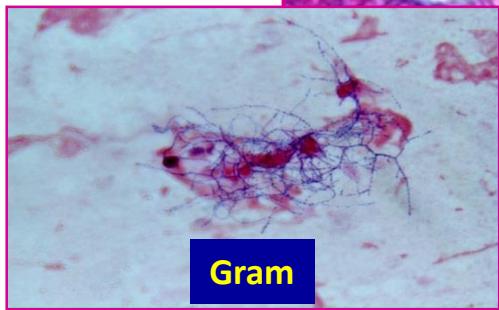

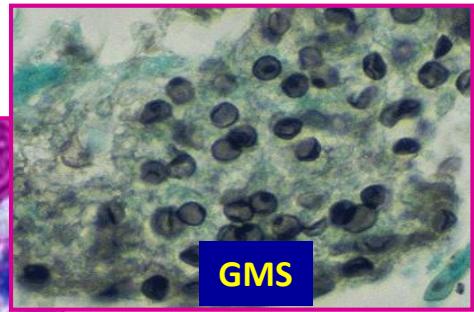

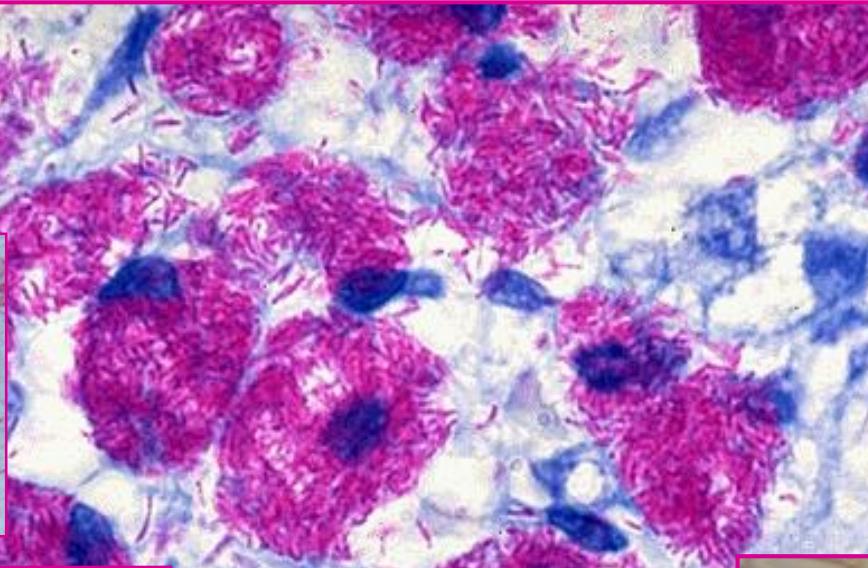

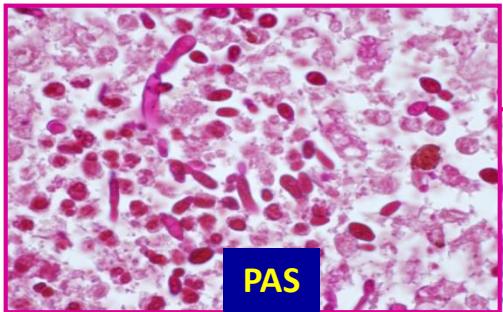

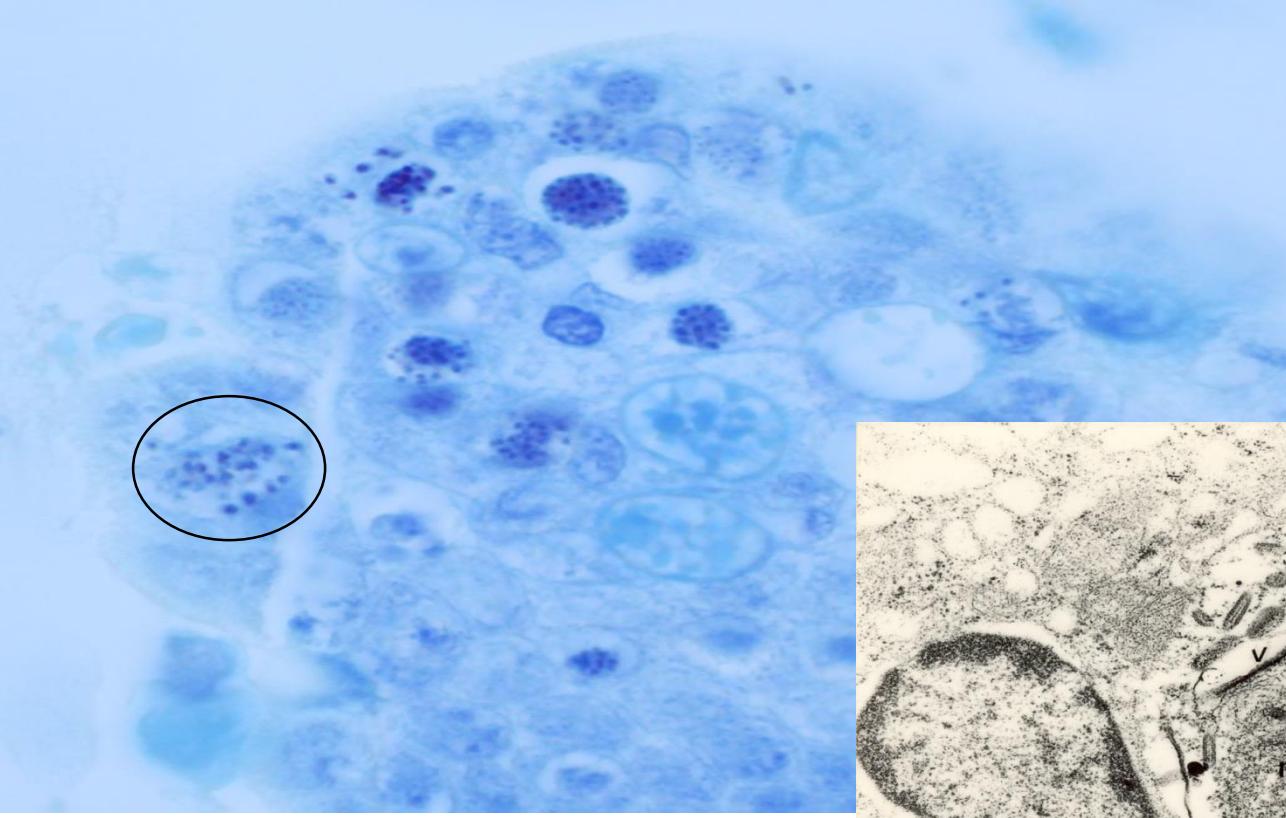

18 Feb 2017 – “Bioterrorists could one day kill hundreds of millions of people in an attack more deadly than nuclear war”

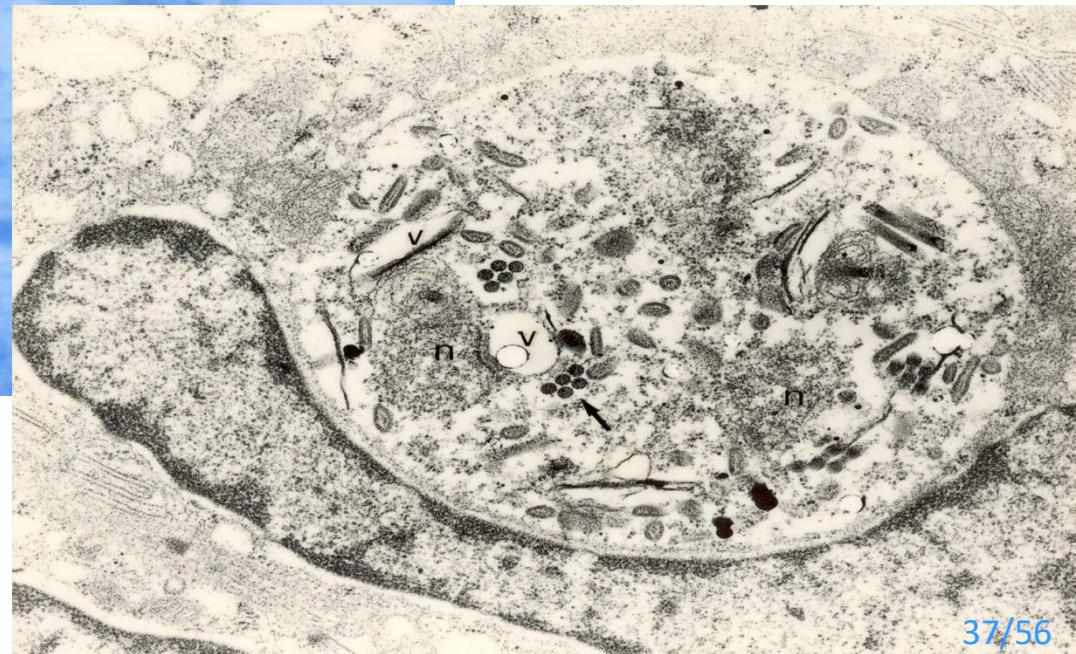

Bill Gates will warn world leaders !

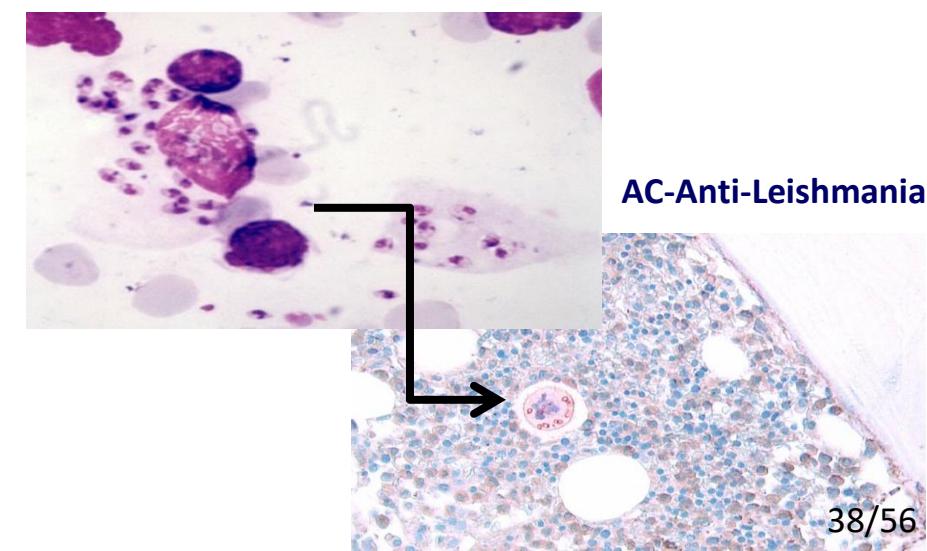

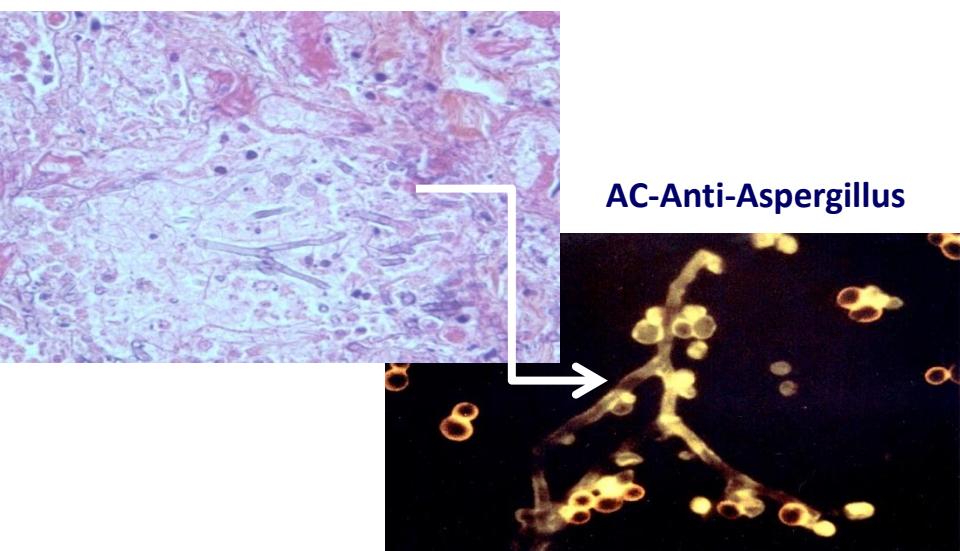

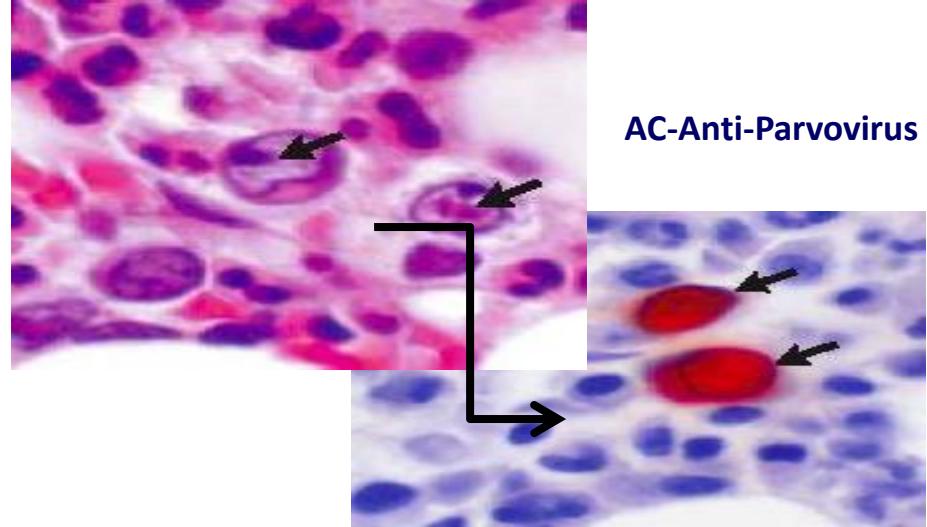

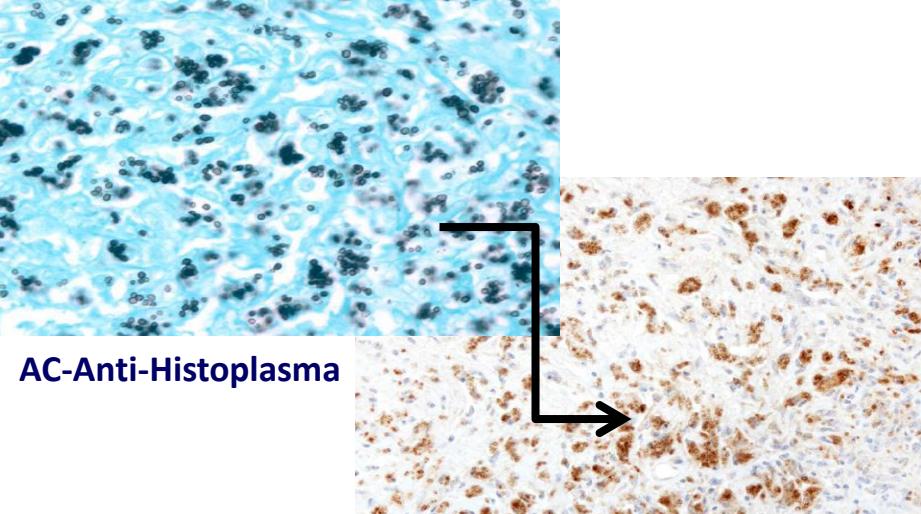

**Which input for the ancillary
methods (old and current) in
infectious diseases pathology ?**

Microsporidiosis
(Enterocytozoon bieneusii)

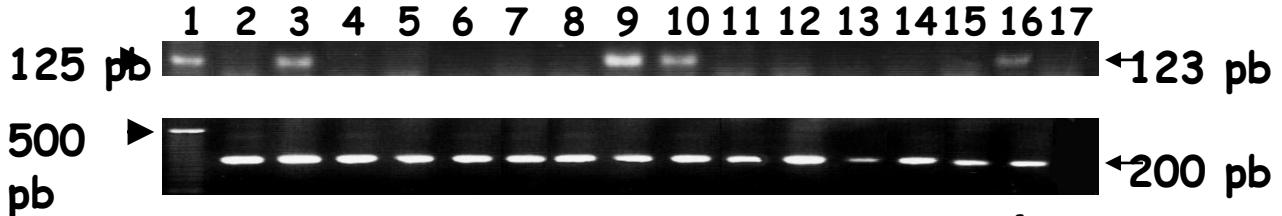

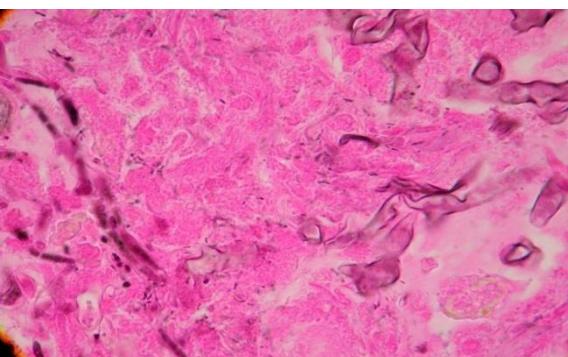

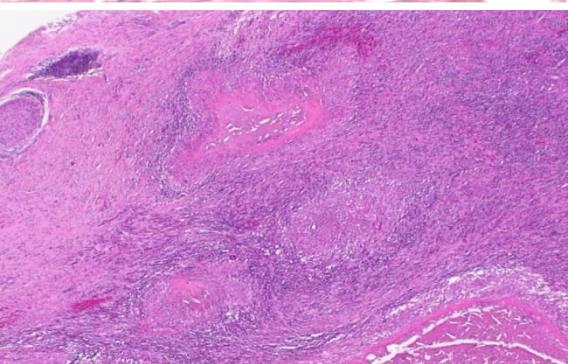

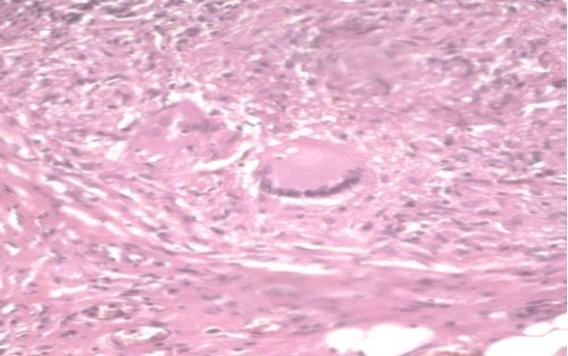

Paraffin sections

Escherichia coli

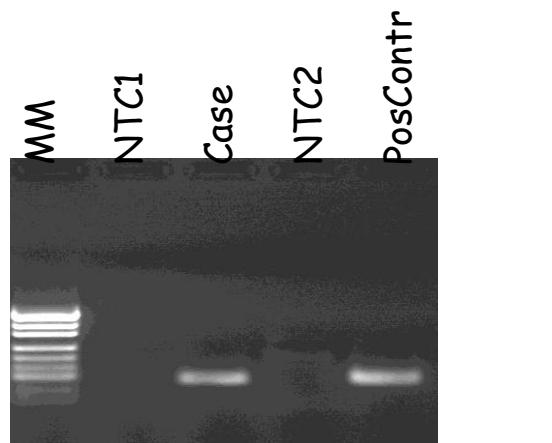

Streptococcus aureus

Salmonella typhimurium

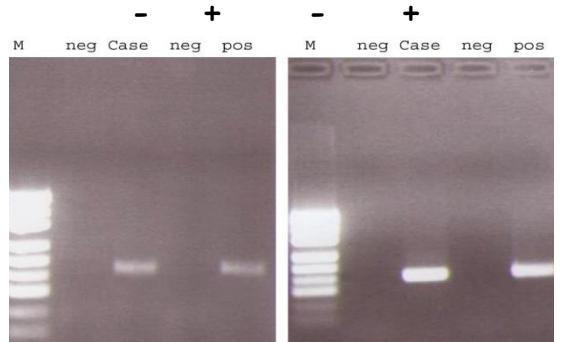

Molecular biology from tissue sections

Mycobacterium tuberculosis

Brucella melitensis

Aspergillus sp. & Mucorales sp.

Opportunities in infectious diseases pathology practice

Increased opportunistic infections following the increasing transplantation, chemotherapy and targeted therapy rates

Increase in imported infectious and tropical diseases in returning travellers and in immigrants

Emerging complications of HIV associated diseases caused by HAART

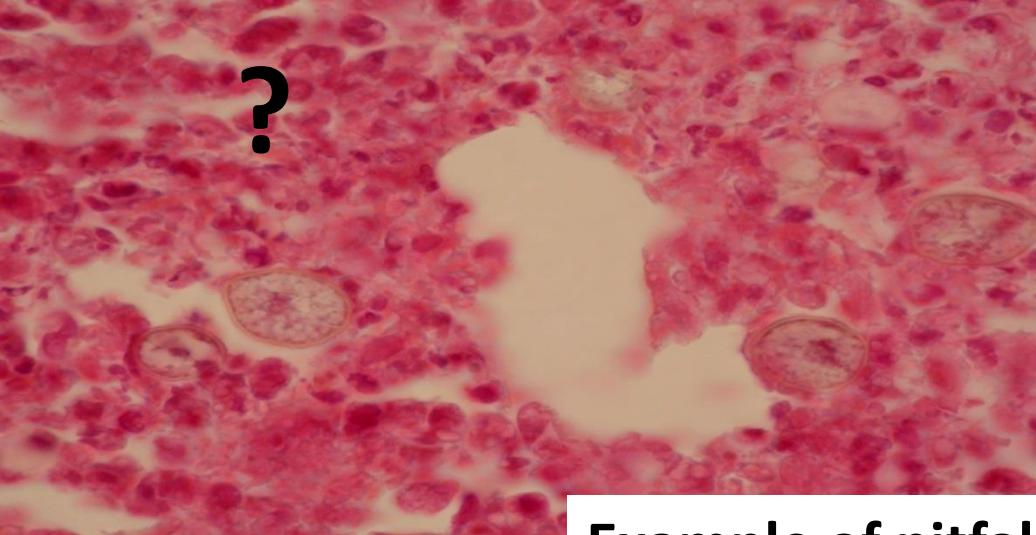

Epidemics of new and emerging or re emerging infectious diseases

Optimisation and development of new ancillary methods to detect pathogens in fixed samples

Opportunity to observe tissue lesions associated with the agent which is synonymous to pathogenicity and infection

Differential diagnosis: non pathogenic lesions mimicking an infection

?

Nasal mucosa

Example of pitfall in ID Pathology field

Nasal mucosa

?

Paracoccidioidomycosis

Nasal mucosa

Nasal mucosa

Myospherulosis

6 constraints in infectious diseases pathology activity

Weak ability to get a **full time job** for doing pathology infectious diseases diagnostic

Weak possibility to have **training in tropical diseases pathology** in tropical countries

Difficulty to maintain a **broad number of antibodies** targeted infectious agents

Low budget for the development of a **molecular pathology infectious** disease unit

Set up weekly **meetings with physicians** concerned by infectious diseases pathology

Sustainability of **autopsy activity** in institutions

3 potential orientation for tomorrow (?)

Increasing the number of supports and of **grants** in infectious diseases pathology (be attractive to the NGP*)

Developing **telepathology** approach for optimisation of the turn around time for **consultation diagnosis** made by experts in infectious and tropical diseases pathology

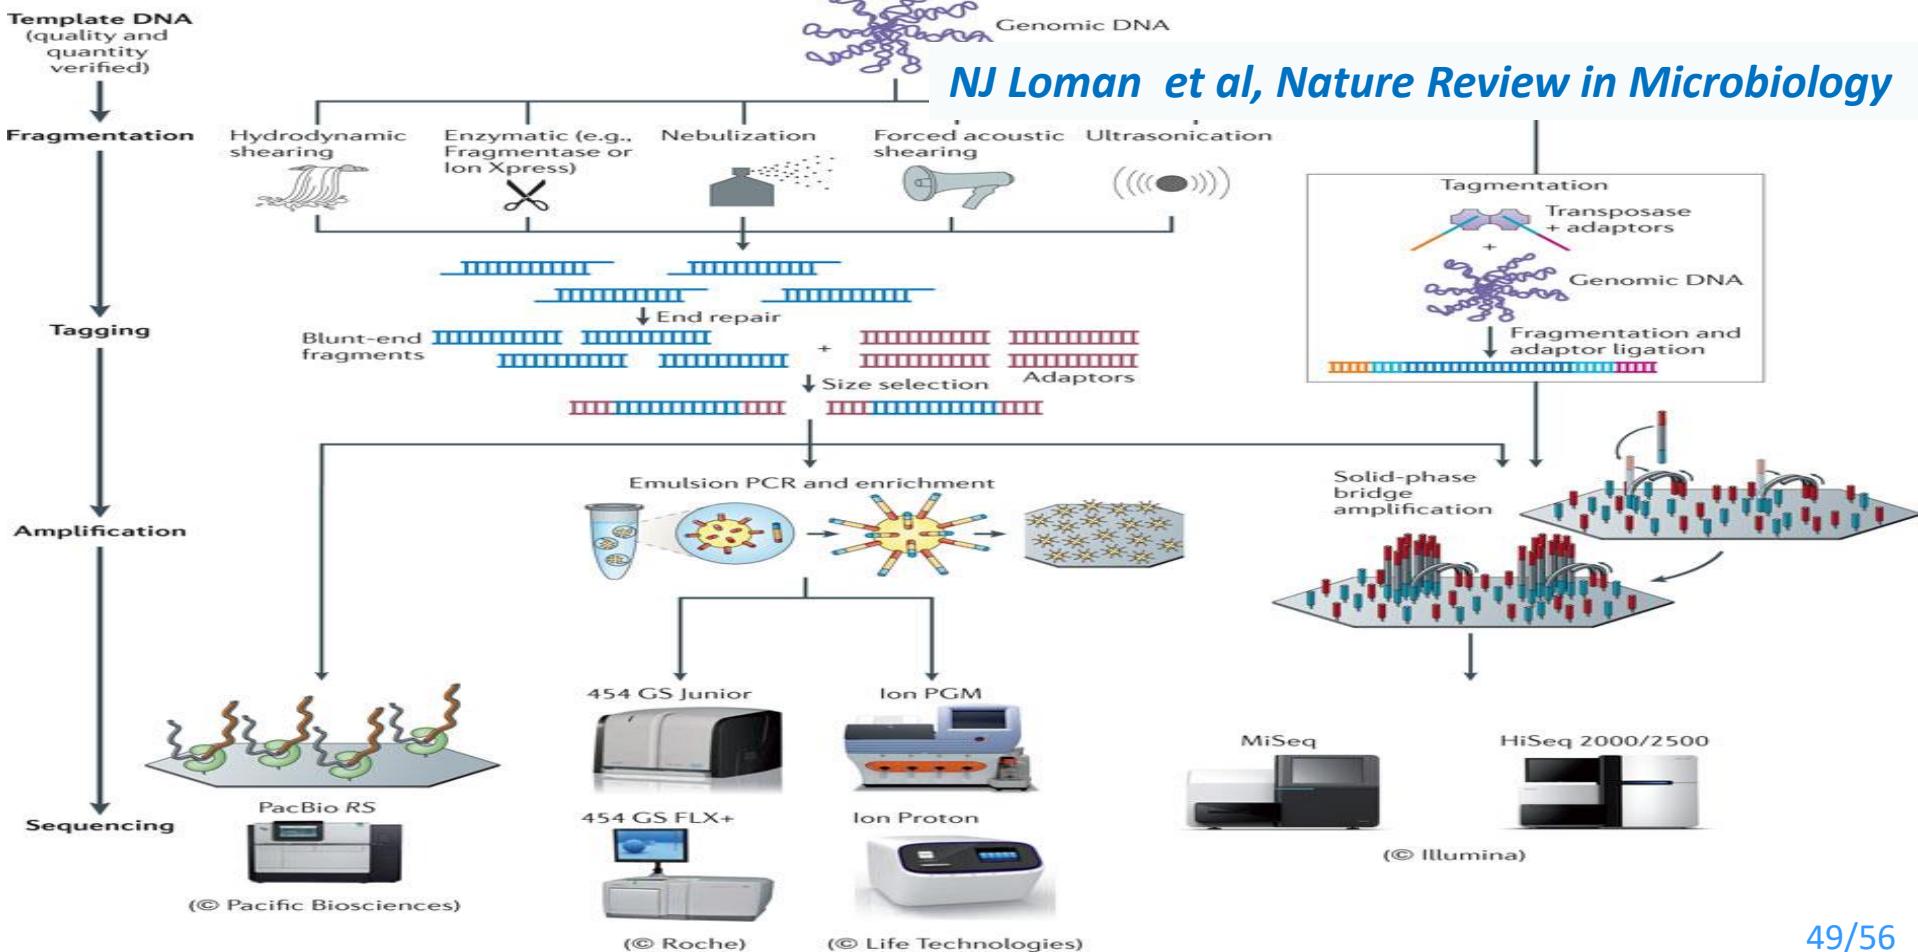

Set up or **sustaining expert centres** in infectious and tropical diseases pathology

*Next Generation of Pathologists

Innovative technologies for the improvement of infectious diseases diagnostic from fixed tissue sections ?

MAIN HIGH-THROUGHPUT SEQUENCING PLATFORMS

Spatial dynamics of HIV-1 spread From 1920 to 1960....!

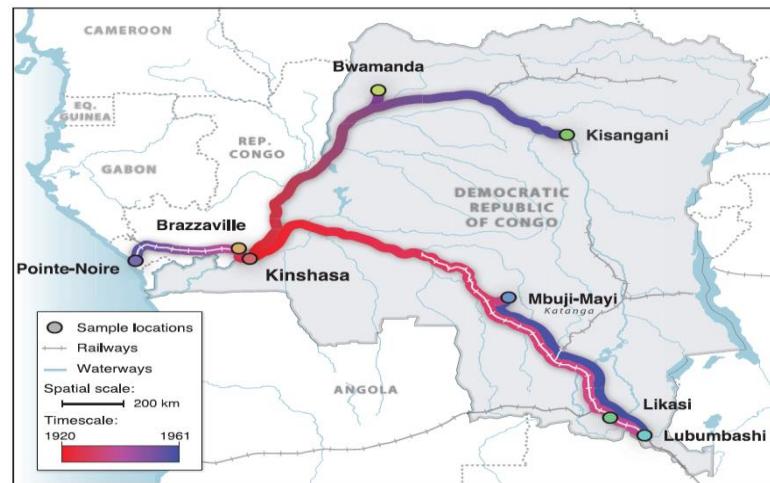

RESEARCH ARTICLE

HIV EPIDEMIOLOGY

The early spread and epidemic ignition of HIV-1 in human populations

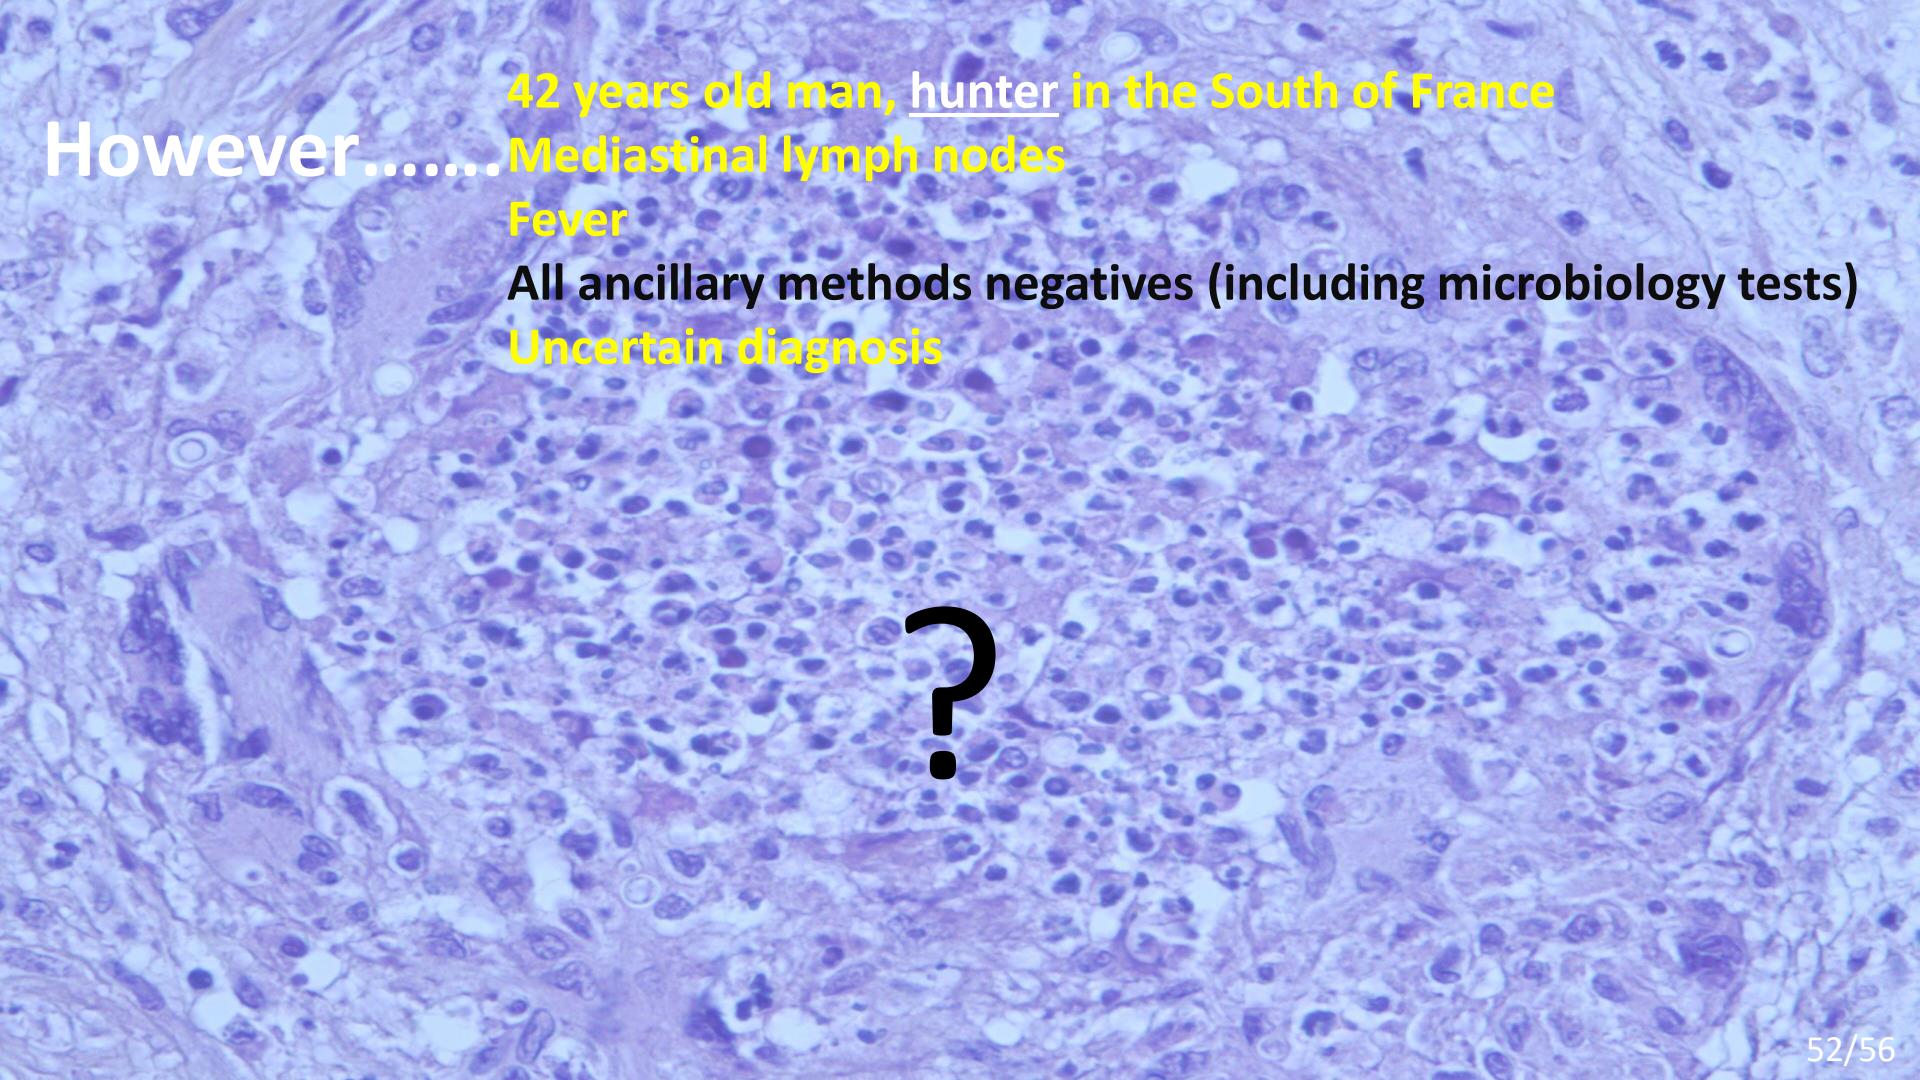

Nuno R. Faria,^{1,2} Andrew Rambaut,^{3,4,5} Marc A. Suchard,^{6,7} Guy Baele,² Trevor Bedford,⁸ Melissa J. Ward,³ Andrew J. Tatem,^{4,9} João D. Sousa,^{2,10} Nimalan Arinaminpathy,¹ Jacques Pépin,¹¹ David Posada,¹² Martine Peeters,¹³ Oliver G. Pybus,^{1*}† Philippe Lemey^{2,*†}

Thirty years after the discovery of HIV-1, the early transmission, dissemination, and establishment of the virus in human populations remain unclear. Using statistical approaches applied to HIV-1 sequence data from central Africa, we show that from the 1920s Kinshasa (in what is now the Democratic Republic of Congo) was the focus of early transmission and the source of pre-1960 pandemic viruses elsewhere. Location and dating estimates were validated using the earliest HIV-1 archival sample, also from Kinshasa. The epidemic histories of HIV-1 group M and nonpandemic group O were similar until ~1960, after which group M underwent an epidemiological transition and outpaced regional population growth. Our results reconstruct the early dynamics of HIV-1 and emphasize the role of social changes and transport networks in the establishment of this virus in human populations.

A careful analysis of the morphological features is still pivotal for identifying most pathogens in tissue sections

Asking for ancillary methods only if necessary

A high-magnification light micrograph of a lymph node biopsy. The image shows a dense population of small, round lymphoid cells with pale cytoplasm and dark nuclei. A prominent feature is a large, solid black question mark centered in the field of view, suggesting uncertainty or a diagnostic challenge.

However.....

42 years old man, hunter in the South of France

Mediastinal lymph nodes

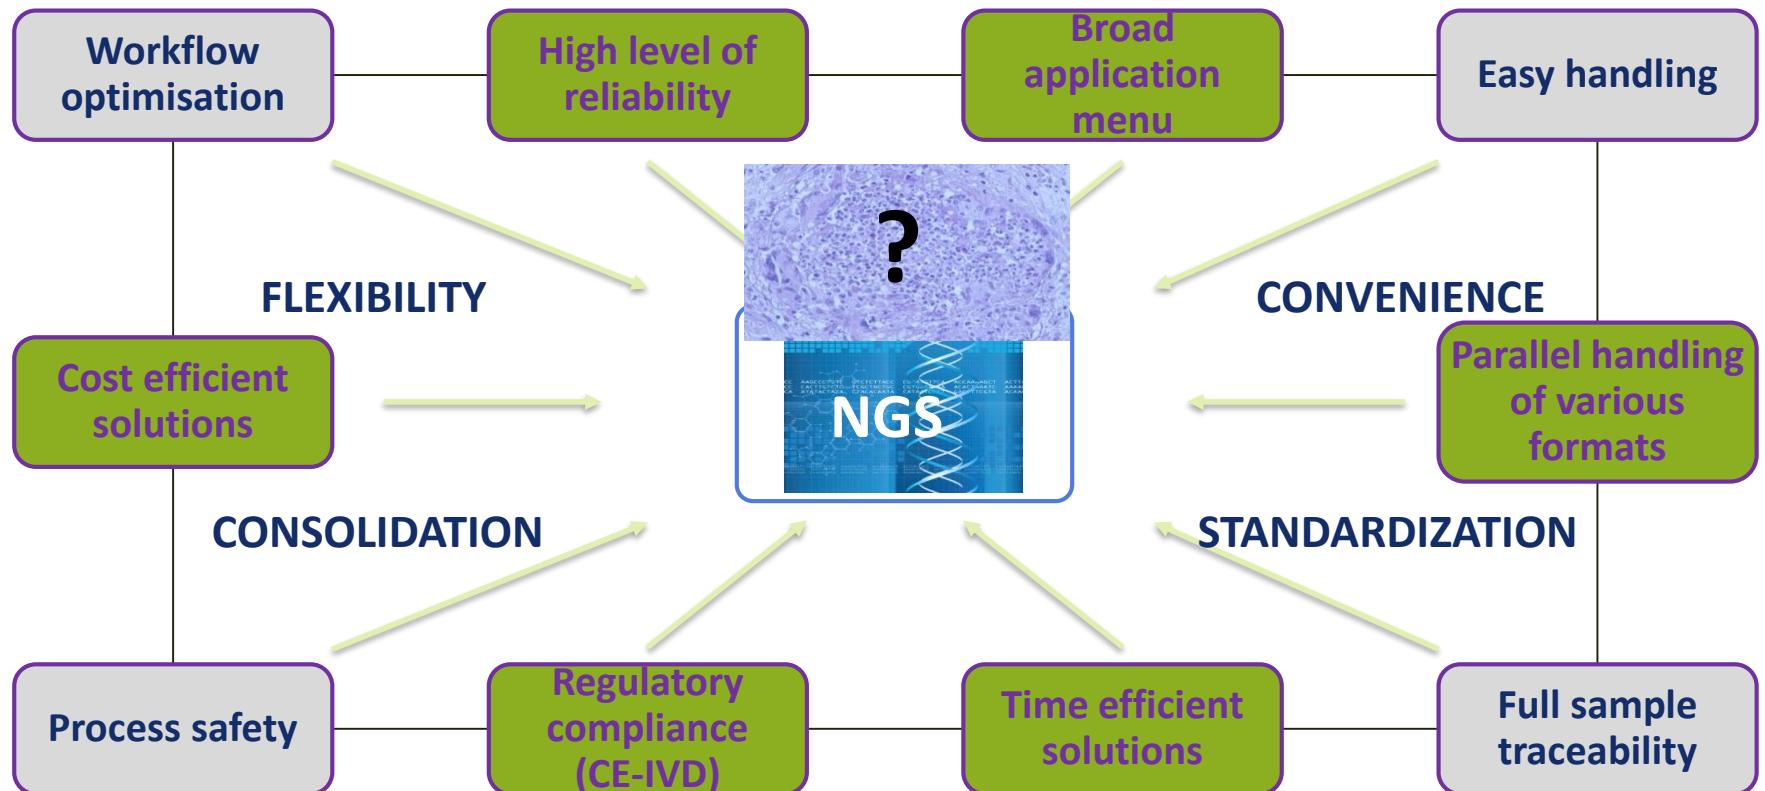

Fever

All ancillary methods negatives (including microbiology tests)

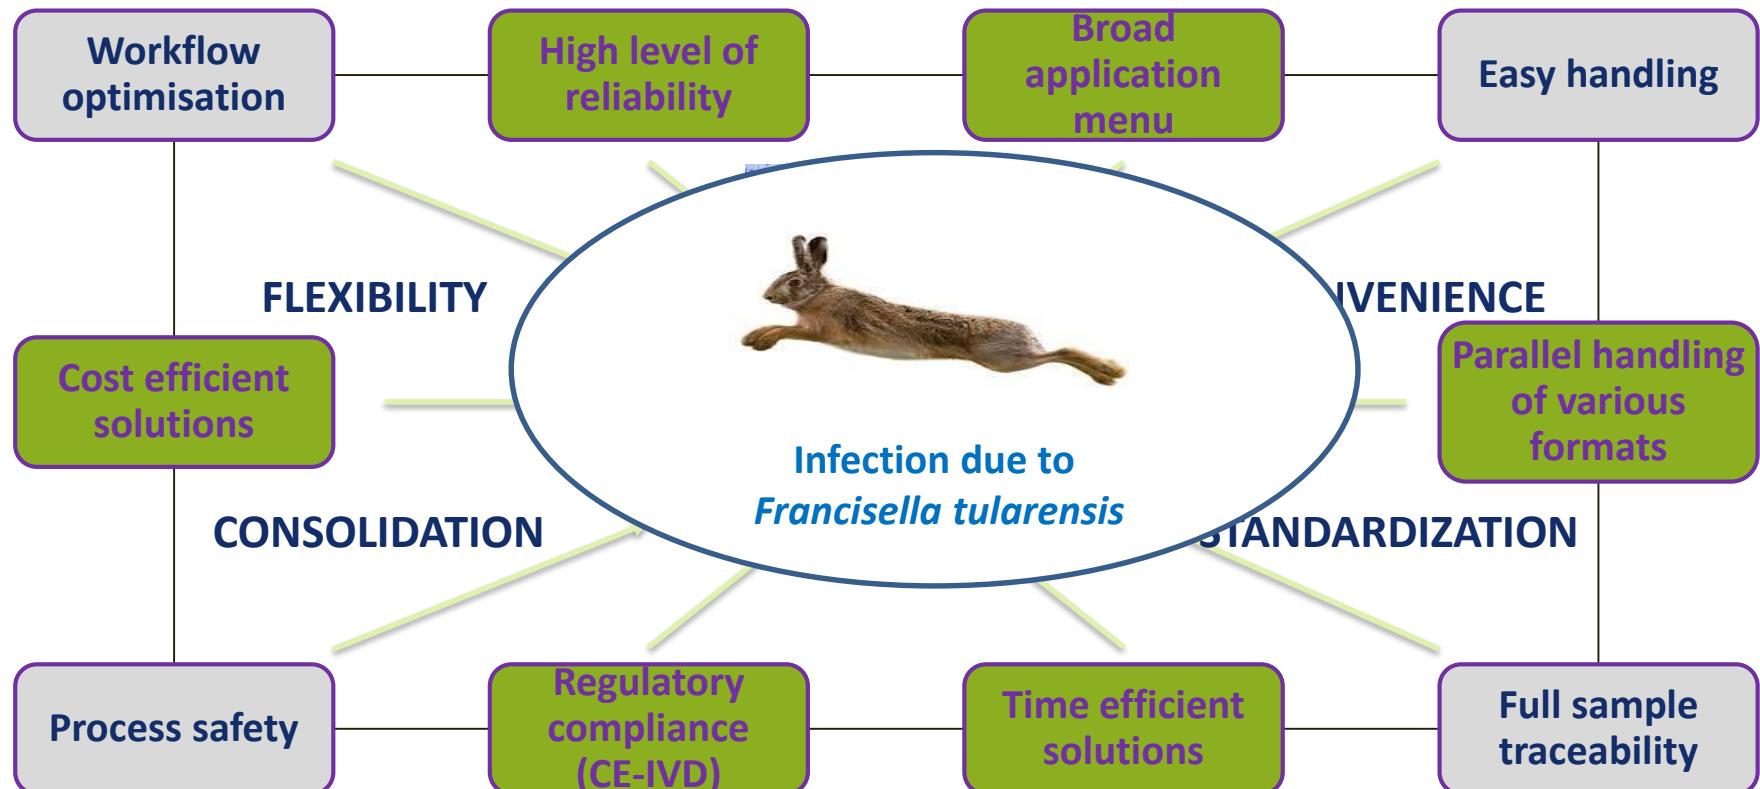

Uncertain diagnosis

?

Needs of molecular diagnosis for routine practice in Infectious diseases from fixed samples: A new challenge for the pathologists or..... for the microbiologists ?

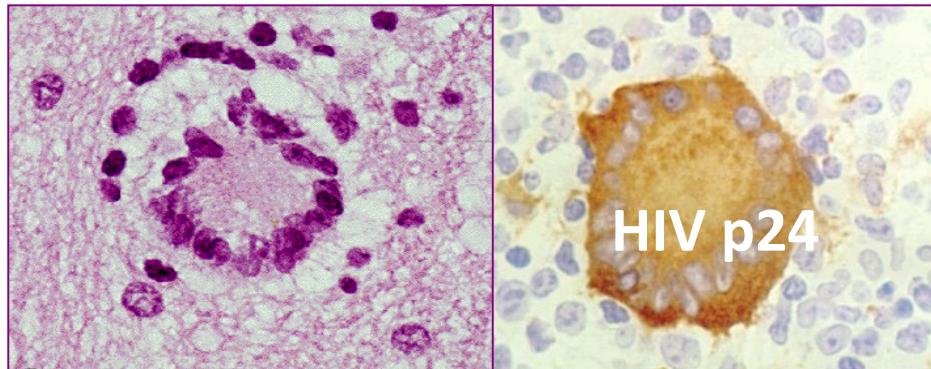

Needs of molecular diagnosis for routine practice in Infectious diseases from fixed samples: a new challenge for the pathologists or for the microbiologists ?

Future role for the pathologist in Infectious Diseases

- Diagnosis, prognosis and theranosis assessment of ID from tissue sections
*(similarly to the role of the **clinical pathologist** in oncology)*
- Optimisation of the molecular pathology approach of ID from tissue sections
*(similarly to the role of the **molecular pathologist** in oncology)*
- Does the molecular pathology in microbiology can be set up in a department of pathology in Europe ?
- Does challenging the microbiologist in molecular pathology still necessary ?
