Biochemical composition

# Diagnosis of Wilson disease using X-ray fluorescence

# The Wilson's disease

ATP7B is a translocase involved in Cu excretion

## Wilson's disease

Mutations in ATP7B → Accumulation of Cu

Rare genetic disease (1/30 000)

# The Wilson's disease

## Clinical symptoms

Hepatic symptoms (45%)  
Chronic hepatitis / cirrhosis

Haemolytic anaemia

Neurologic symptoms (35%)

Psychiatric troubles (10%)

## False positive

Autoimmune hepatitis  
Sever hepatic insufficiency  
Familial aceruloplasminaemia

## Diagnosis

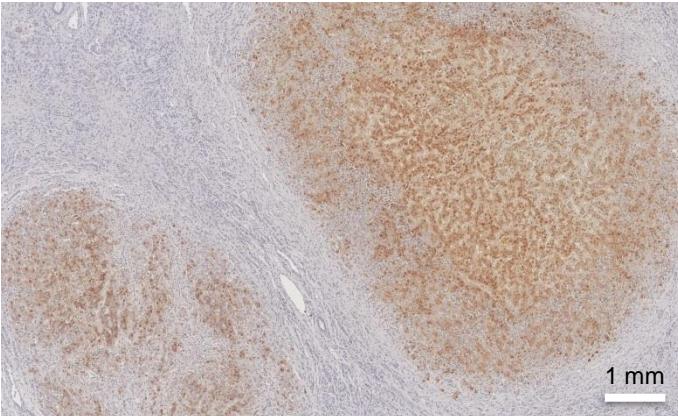

Numerous mutations (>500) on ATP7B  
(long and expensive)

Kayser-Fleischer ring (50%)

Histological examination  
(rhodanine staining)

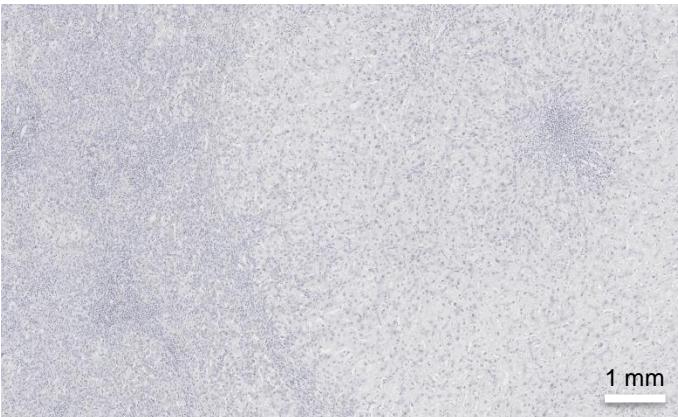

# Diagnosis of the Wilson's disease

Patient #55  
Wilson's disease

Rhodanine staining  
positive

Patient #53  
Wilson's disease

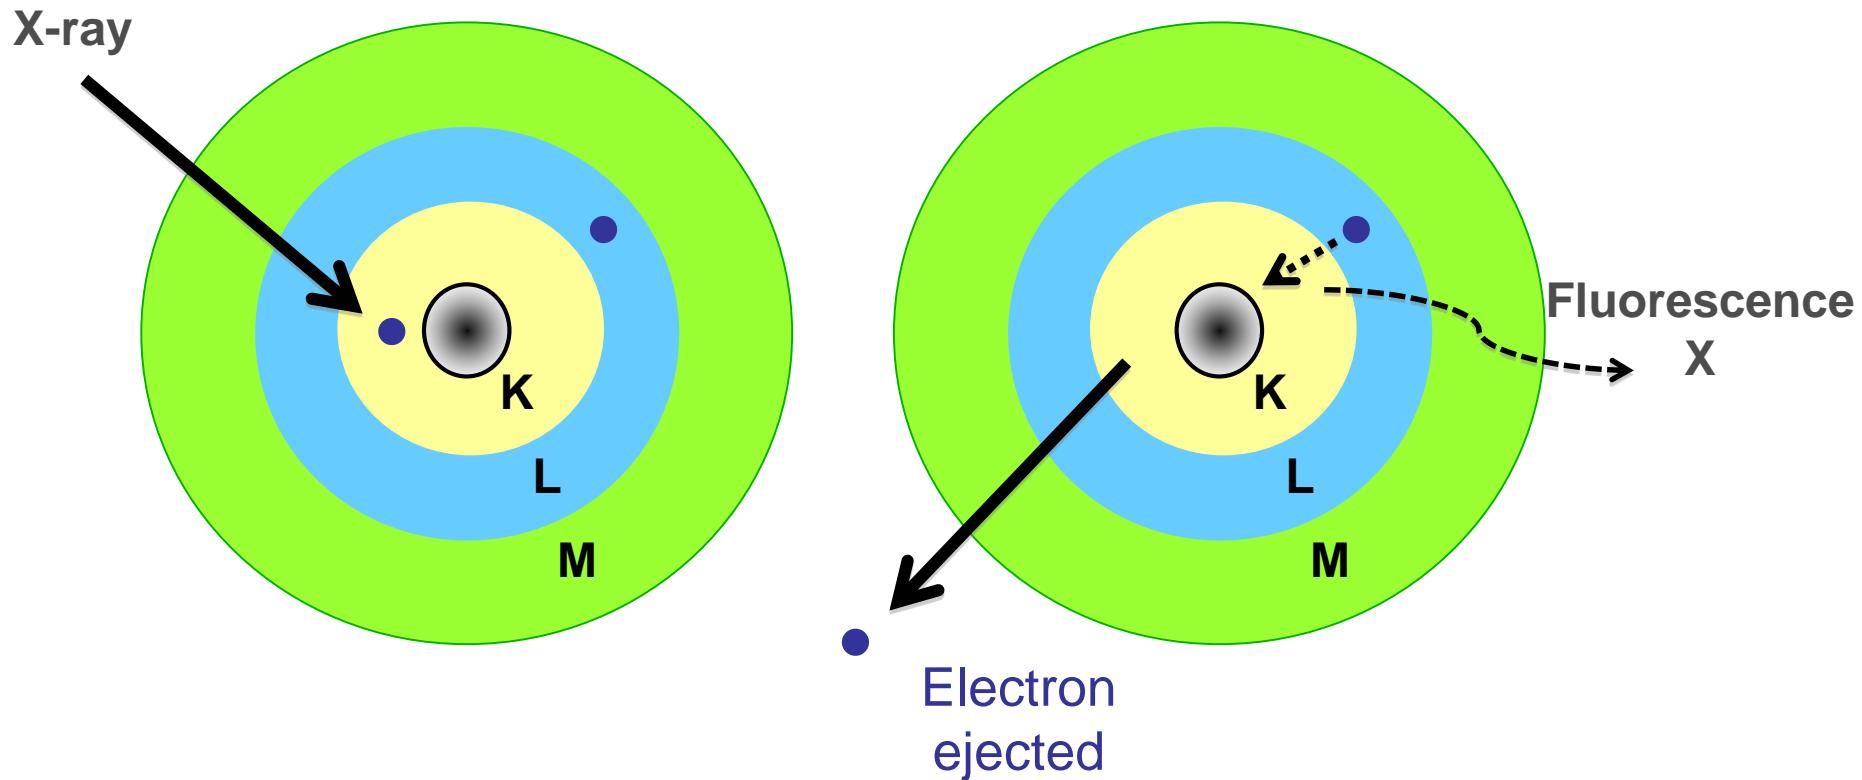

Rhodanine staining  
negative

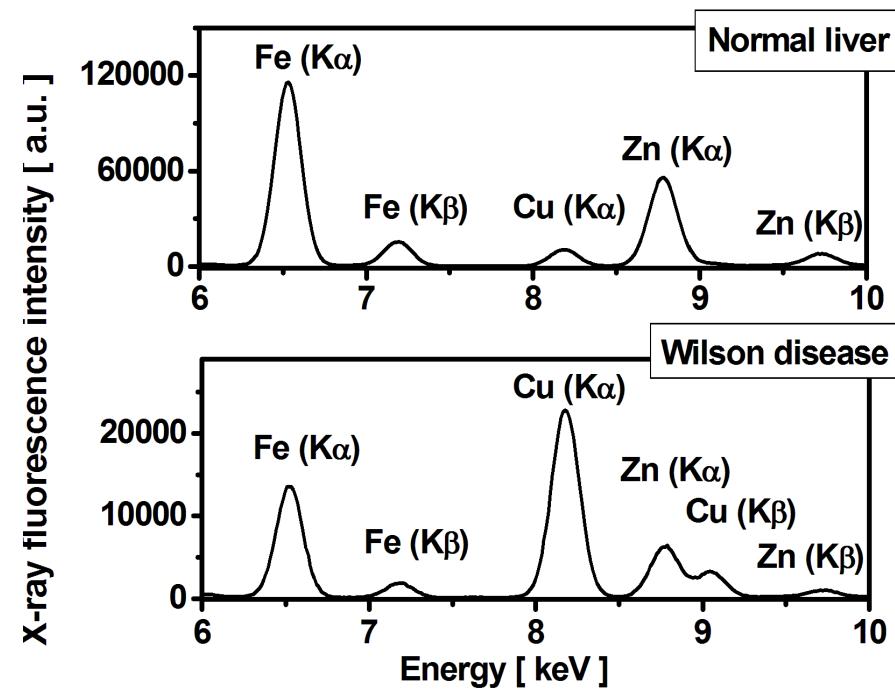

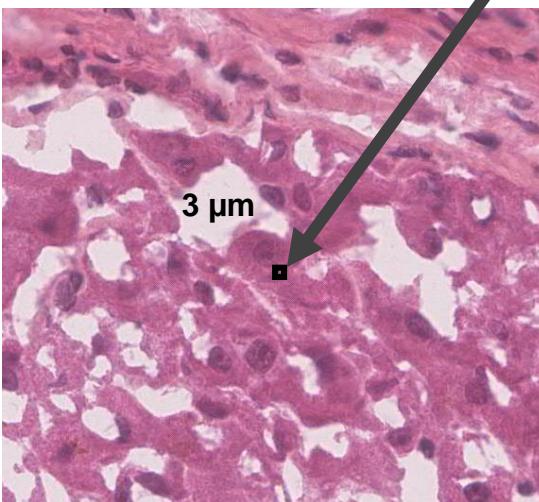

FALSE NEGATIVE

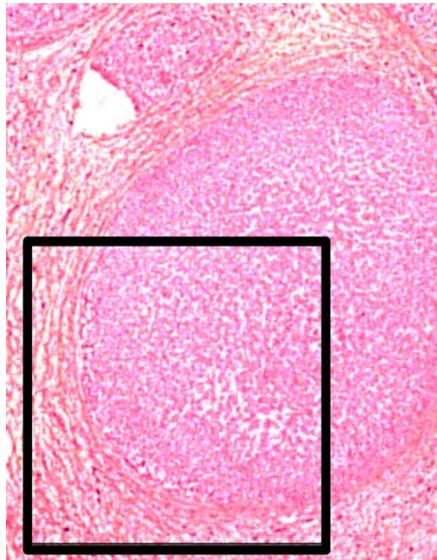

# X-ray fluorescence

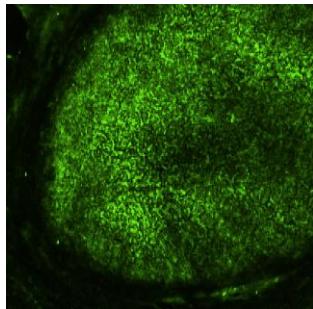

# X-ray fluorescence on Wilson's disease

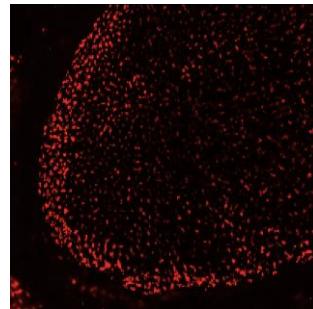

# X-ray fluorescence on Wilson's disease

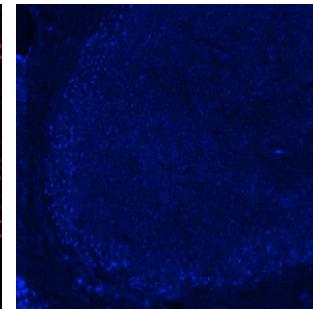

Fe

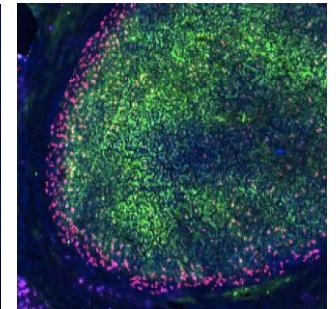

Cu

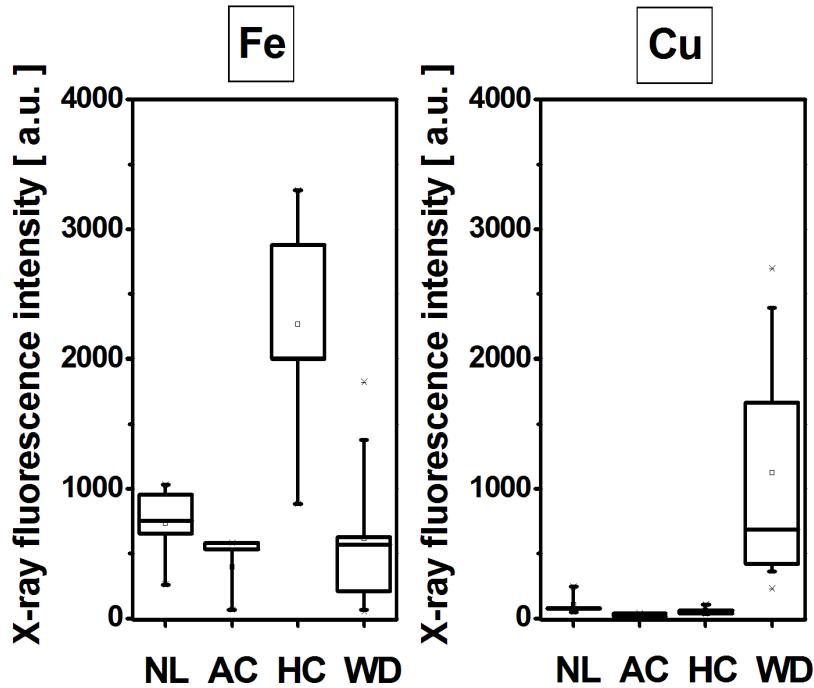

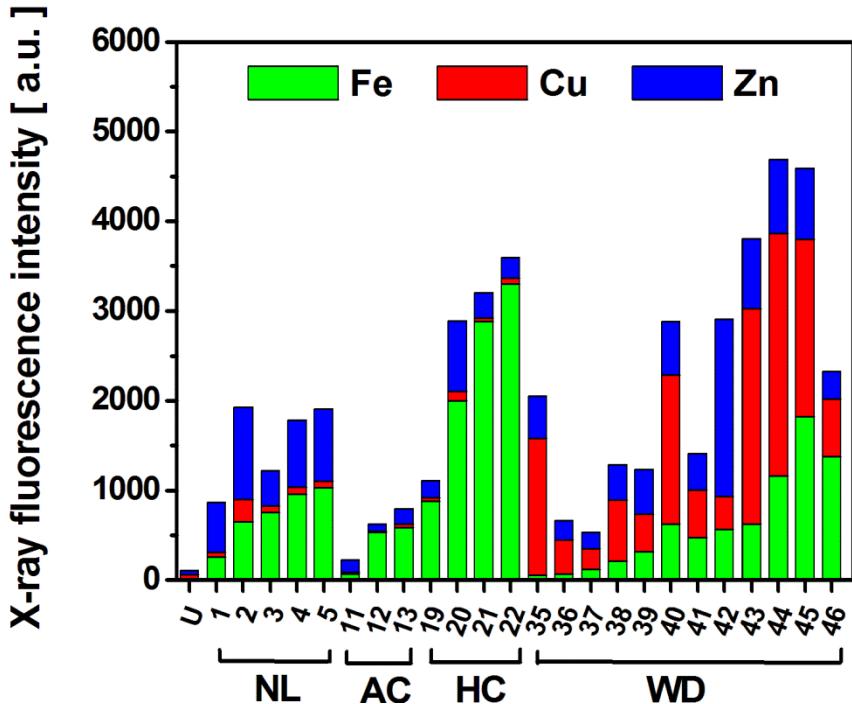

Zn

Merge

# Diagnosis of Wilson's disease on tissue sections using X-ray fluorescence

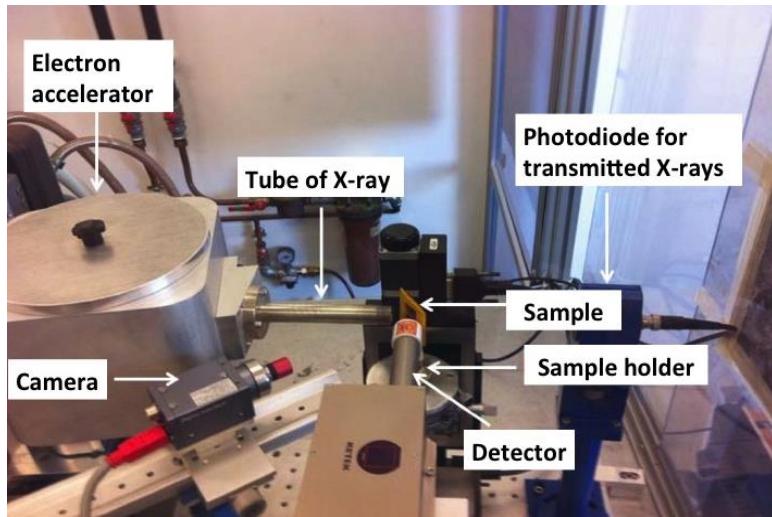

Diagnosis in 2h

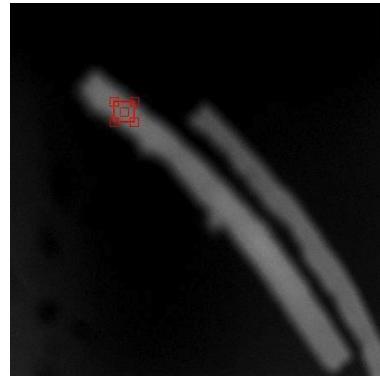

NL: normal liver AC: alcoholic cirrhosis HC: hemochromatosis WD: Wilson's disease

# From synchrotron to the hospital

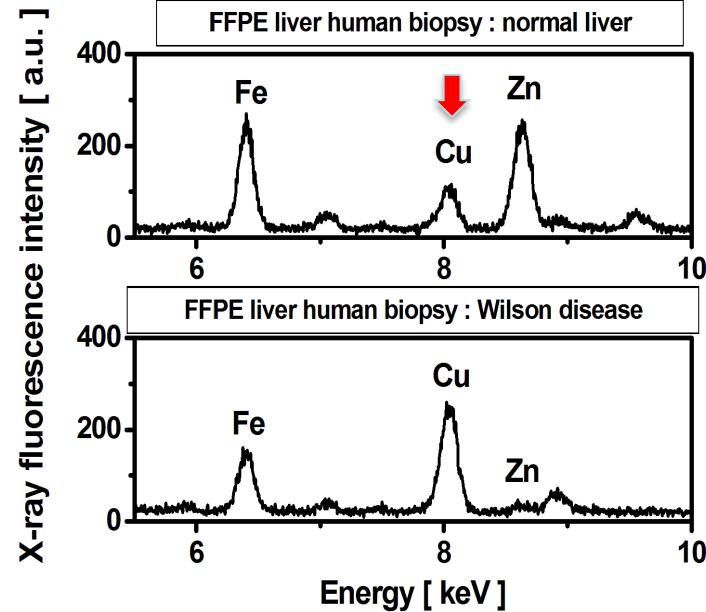

Laboratory X-ray source

Needle biopsy  
(FFPE)

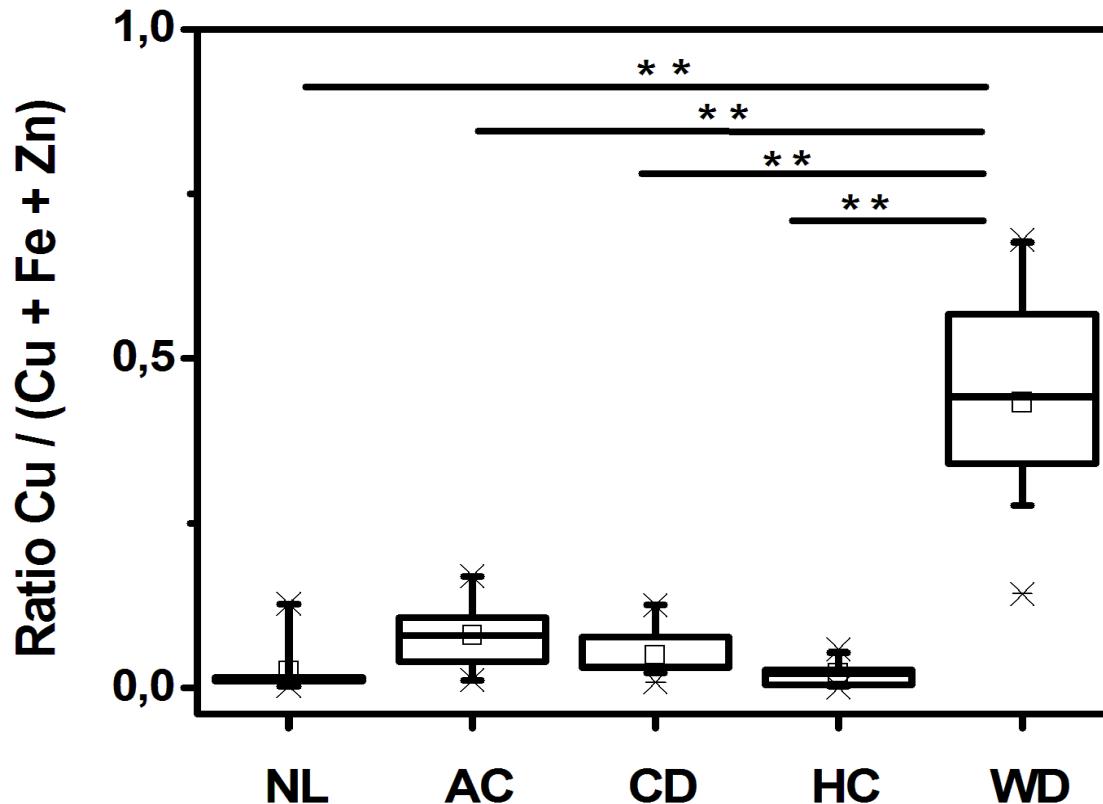

Beam size :  $\varnothing 150 \mu\text{m}$

Diagnosis in 30 min

# Diagnosis of Wilson's disease on needle biopsies using X-ray fluorescence

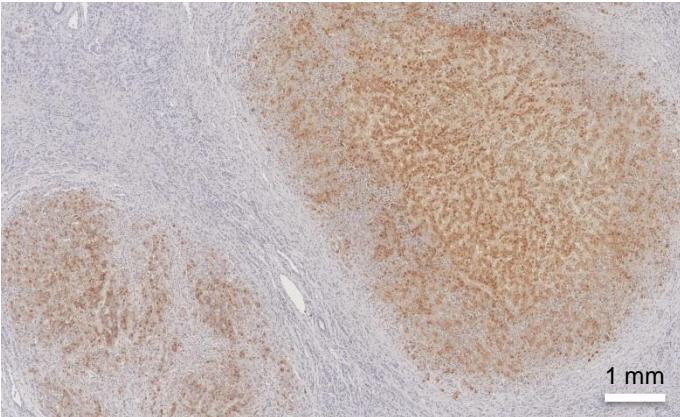

**Specificity 97.6%**

**Sensitivity 100%**

NL: normal liver  
AC: alcoholic cirrhosis  
CD: cholestase disease  
HC: hemochromatosis  
WD: Wilson's disease

# Diagnosis of the Wilson's disease

Patient #55  
Wilson's disease

Rhodanine staining  
positive

Patient #53  
Wilson's disease

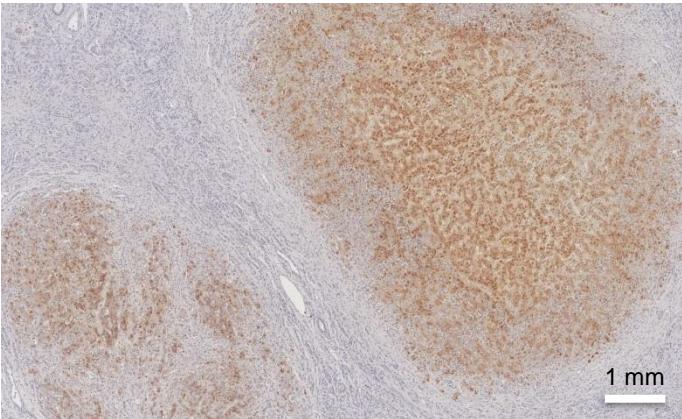

Rhodanine staining  
negative

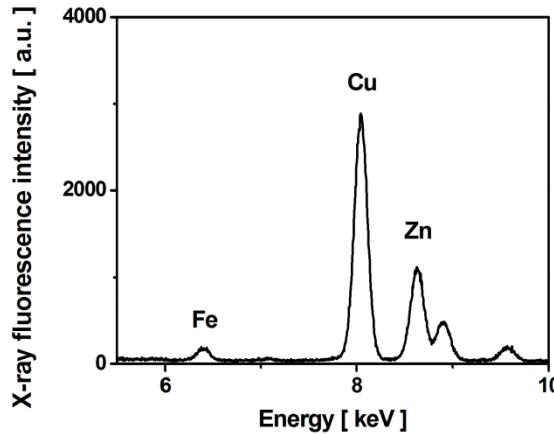

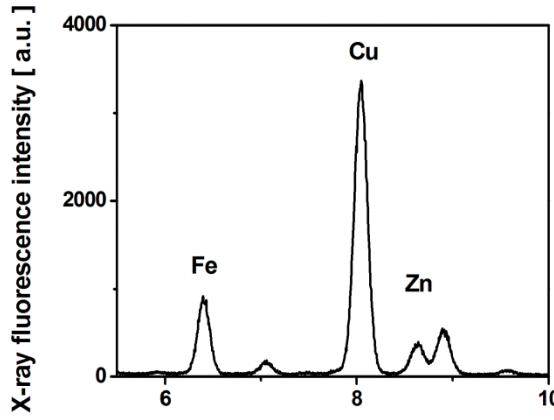

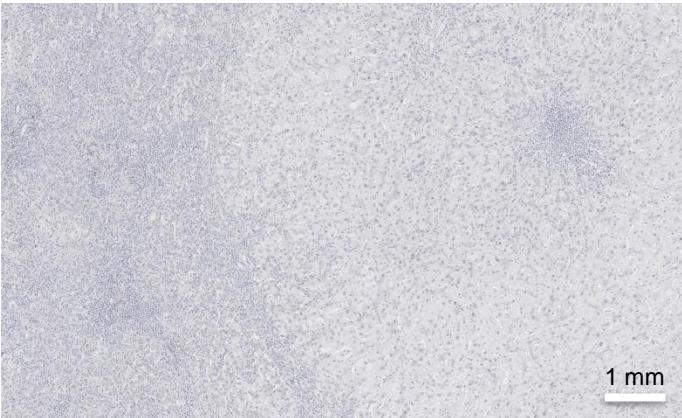

FALSE NEGATIVE

# Diagnosis of the Wilson's disease

Patient #55  
Wilson's disease

Patient #53  
Wilson's disease

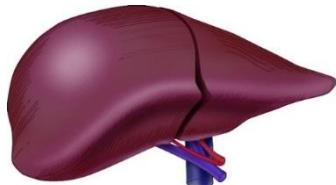

# Conclusion

- Versatile (compatible with fresh, frozen or parrafin embedded tissues)
- Compatible with tissue sections and needle biopsies
- No staining & no specific preparation
- Non destructive
- Quantitative
- Rapidity: diagnosis in 30 min!

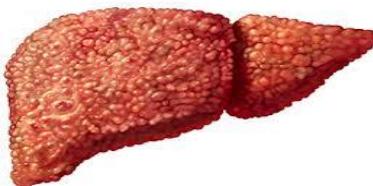

→ Rapid and reliable diagnosis of Wilson disease using X-ray fluorescence

# Chronic liver diseases and cancer

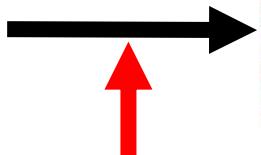

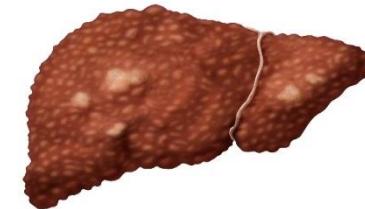

Normal liver

Cirrhosis

Hepatocellular  
Carcinoma

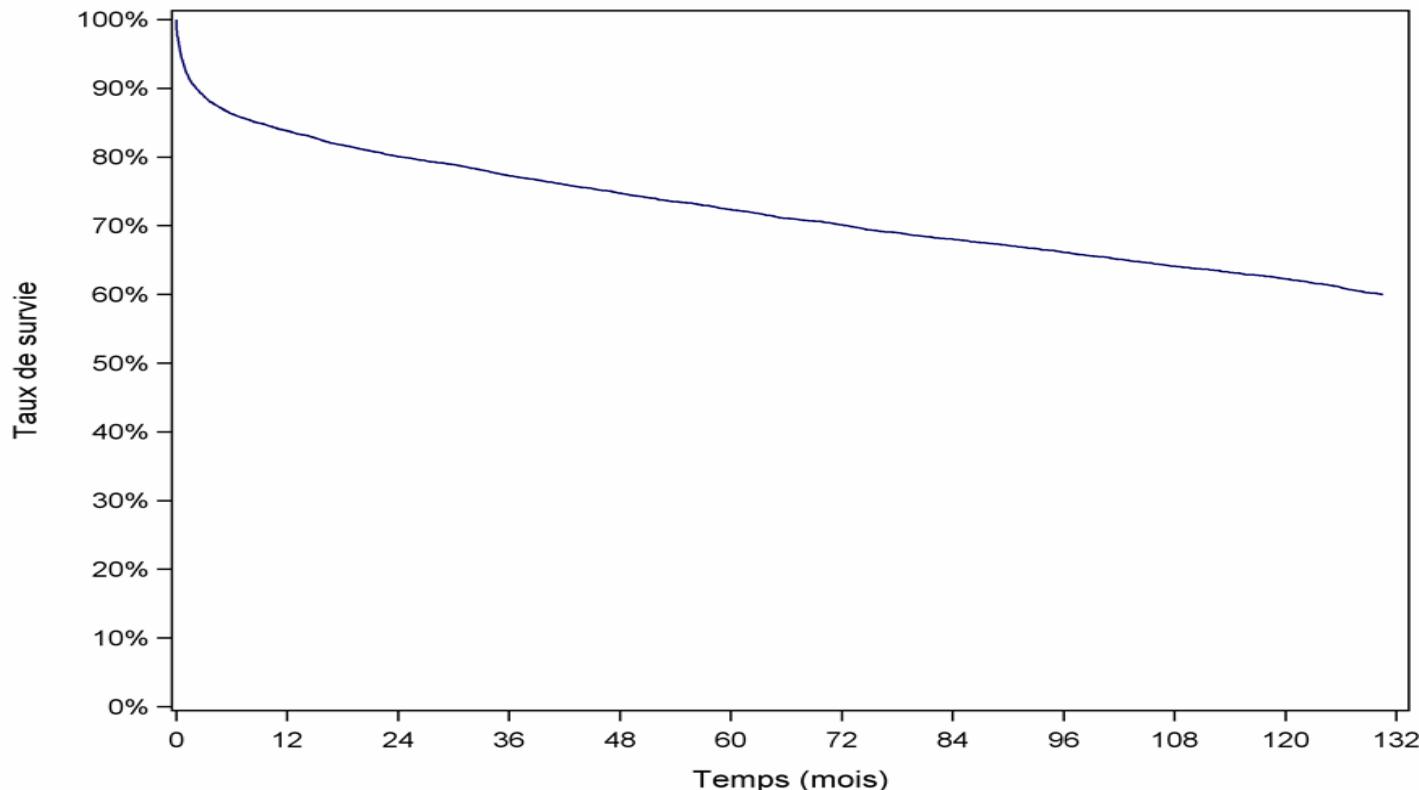

Alcohol  
Dysmetabolic syndrome  
(diabete, obesity)  
Viral Hepatitis

6<sup>th</sup> cause of cancer worldwide  
2<sup>nd</sup> cause of death by cancer  
Poor prognosis (survival < 1 year)

**TRANSPLANTATION**

# Liver transplantation : a major treatment for liver diseases

# Limitation of liver transplantation Shortage of grafts

Year	Transplantation	Waiting patients
2005	1024	474
2006	1037	486
2007	1061	540
2008	1011	574
2009	1047	669
2010	1092	806
2011	1164	932
2012	1161	941

# Limitation of liver transplantation

## Shortage of grafts

- Additional grafts: living donors, graft splitting, domino program, use of marginal grafts, non-heart-beating donors

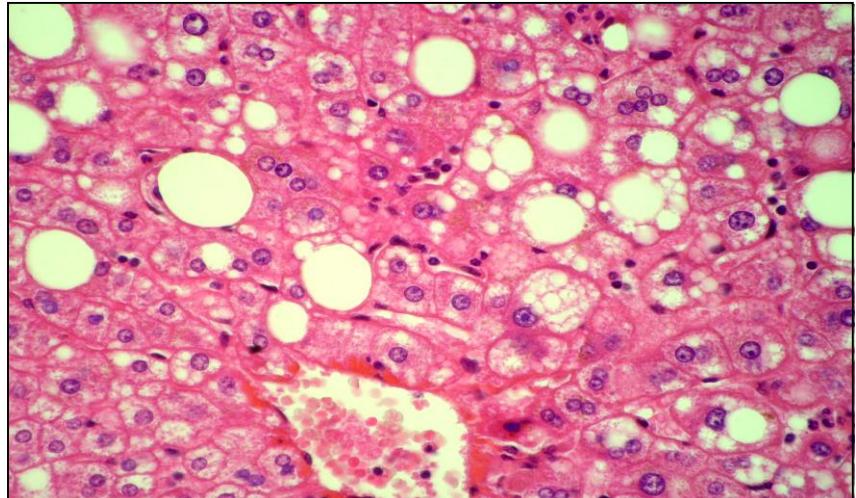

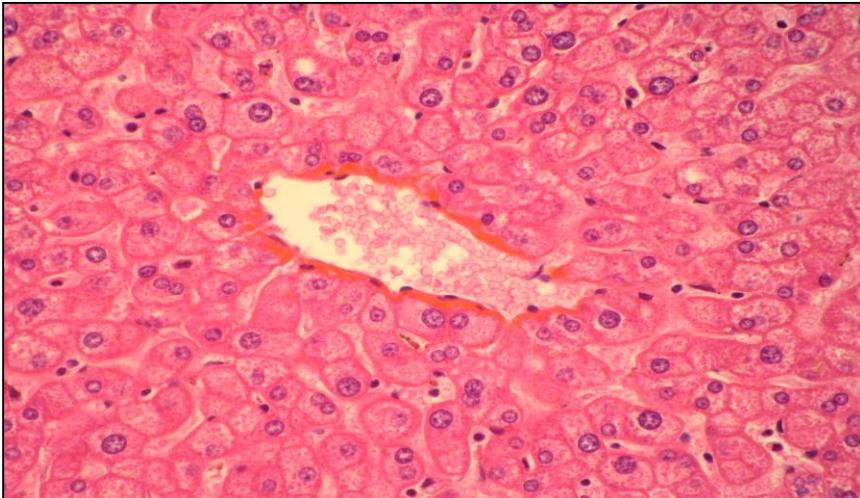

Additional grafts BUT increased risk...

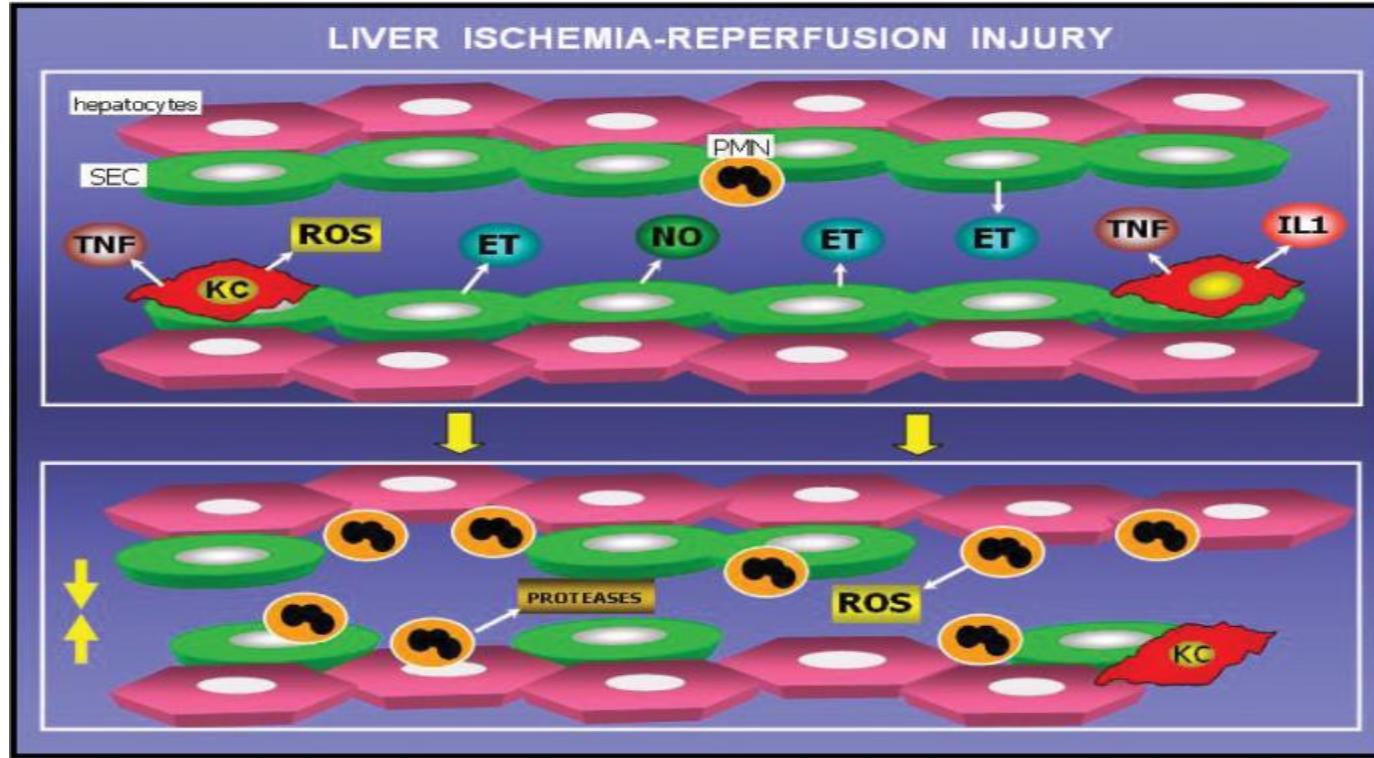

→ Quality of the graft: Steatosis

# Liver steatosis

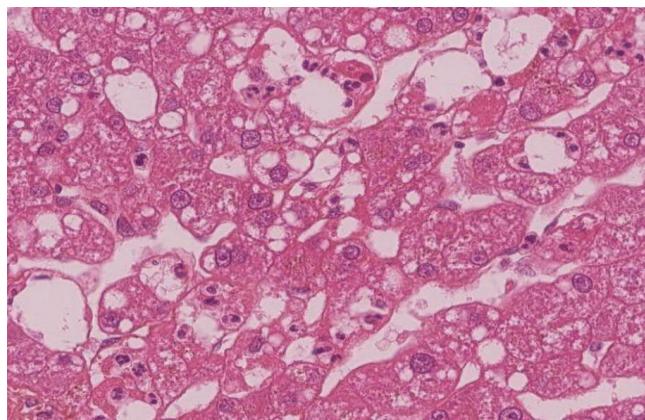

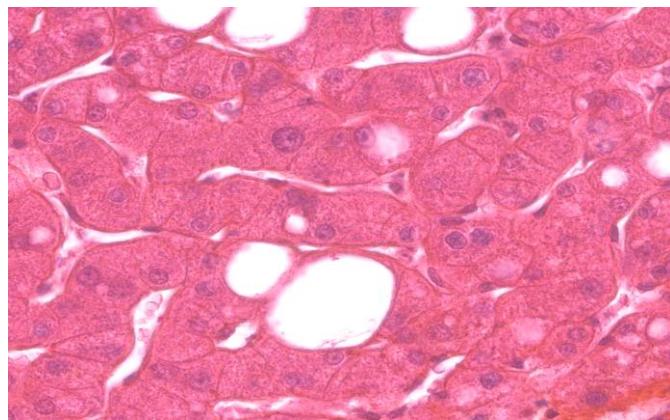

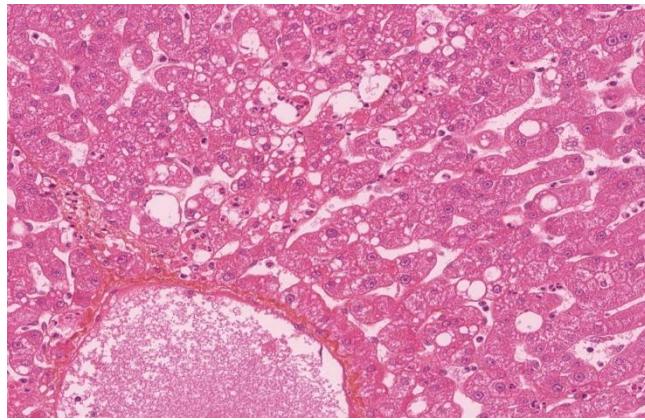

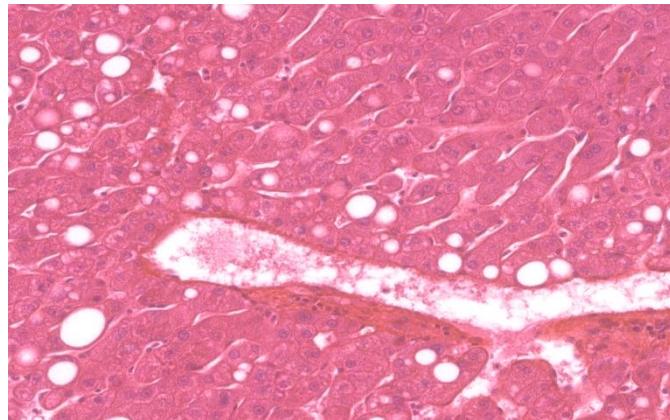

Steatosis: excess of fat in hepatocytes (TG) Lipid droplets in at least 5% of cells

Steatosis sensibilizes liver to ischemia-reperfusion lesions through altered blood flow in liver microcirculation and enhanced peroxydation of membrane lipids

# Ischemia-Reperfusion lesions in liver graft

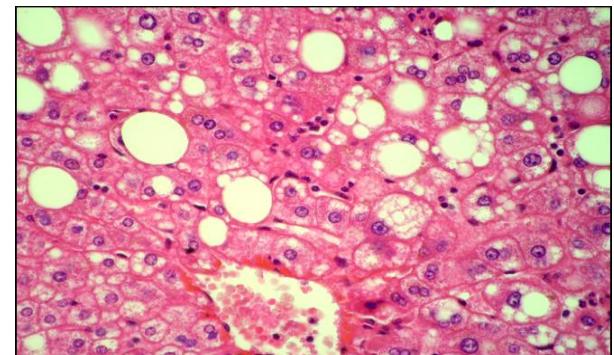

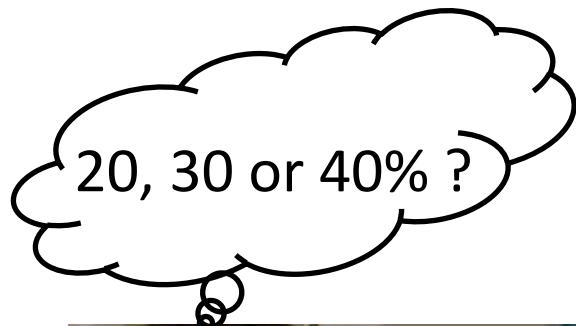

# Liver graft & steatosis

- Steatosis <30%  
low incidence
- Steatosis 30-60%  
35% delayed function  
15% non primary function
- Steatosis >60%  
80% non primary function

# Quantification of steatosis

# Estimation of steatosis

# Assessment of Hepatic Steatosis by Expert Pathologists: The End of a Gold Standard

El-Badry, et al Annals of Surgery. 2009; 250(5):691-697

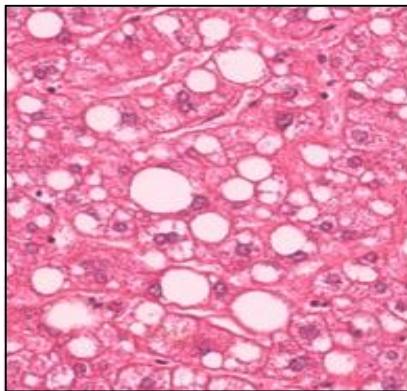

**TABLE 3.** The Pathologists' Quantitative Estimation of Total, Micro- and Macrosteatosis

	Pathologist <b>1</b>	Pathologist <b>2</b>	Pathologist <b>3</b>	Pathologist <b>4</b>	<b>ICC</b>
Total steatosis (%)	20	12.5	20	10	0.57
Microsteatosis (%)	10	5	0	0	0.22
Macrosteatosis (%)	10	5	12.5	10	0.55
Median values of the assessment of total, micro- and macrosteatosis hepatocytes were collected. The intra-class correlation coefficients (ICCs) indicate poor agreement among the pathologists regarding the quantitative (total steatosis) and qualitative (micro- and macrosteatosis) evaluations.					

Poor inter-observer reproducibility

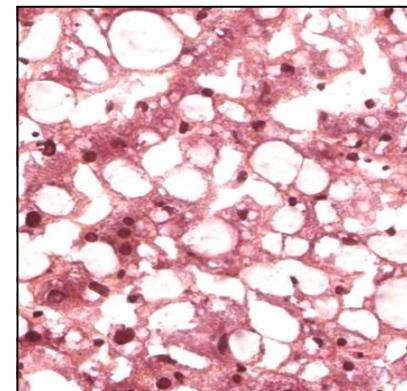

# Estimation of steatosis in the context of emergency

Paraffin

> 24h

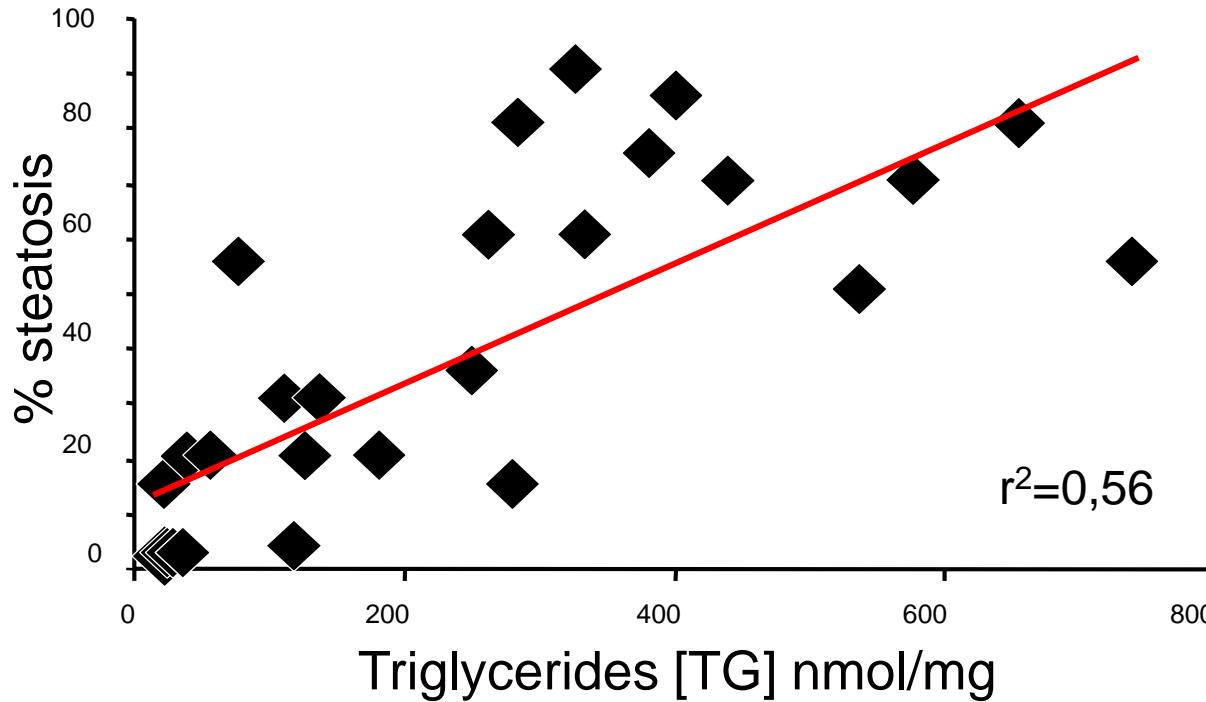

Frozen

< 15 min

A liver transplantation has to be performed in less than 8h...

# Histological estimation of steatosis is not correlated to the lipid content

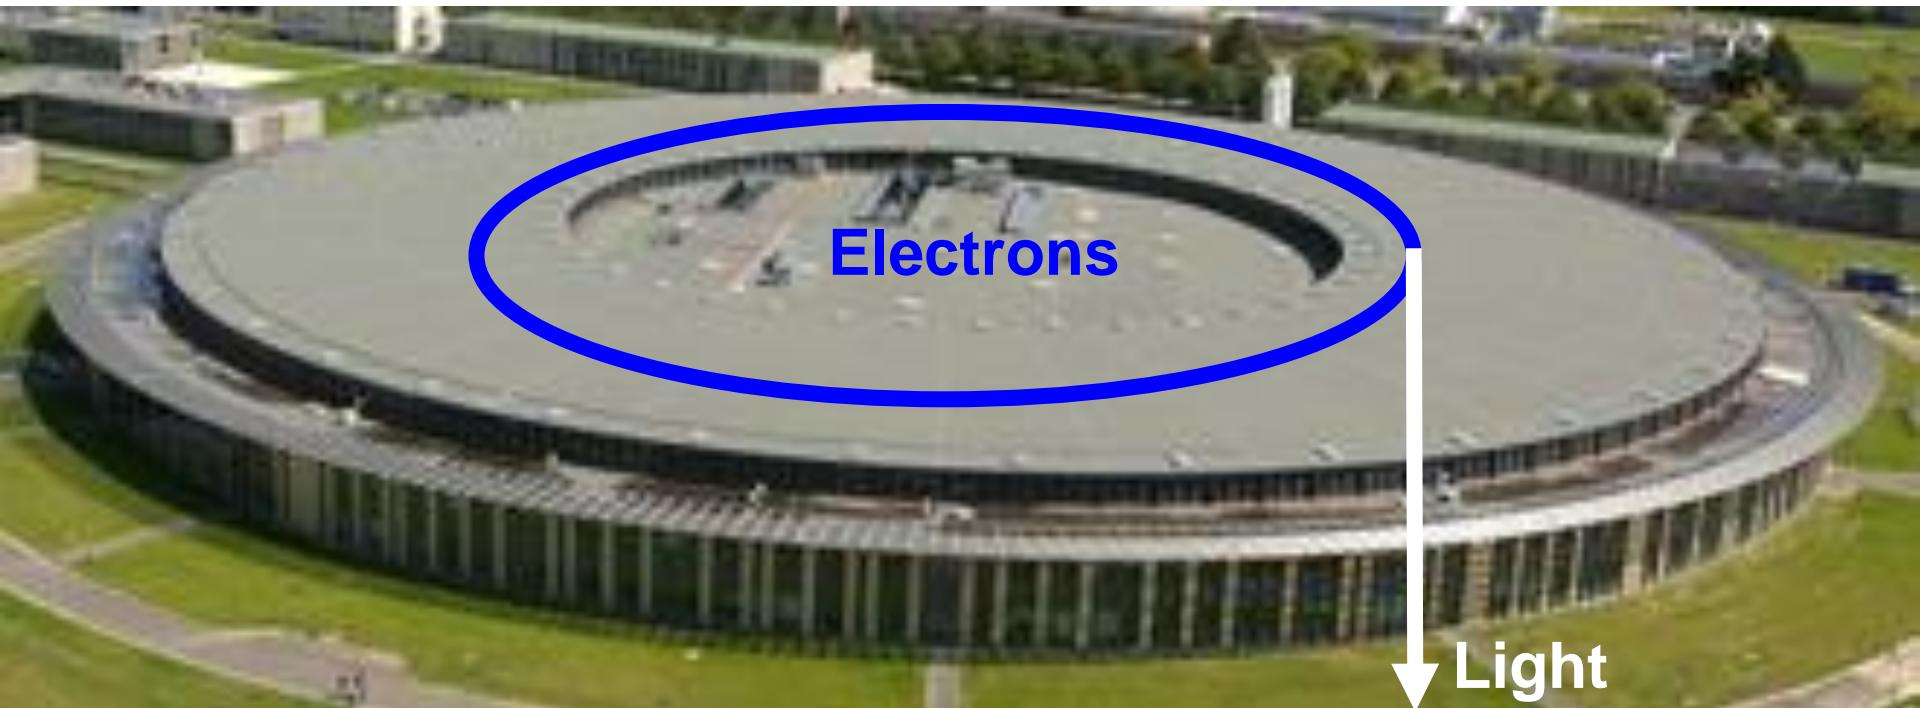

# *Histological estimation of steatosis*

- Poor inter-observer reproducibility
- Poor conservation of the morphology on frozen tissue sections
- Not correlated to the true lipid content

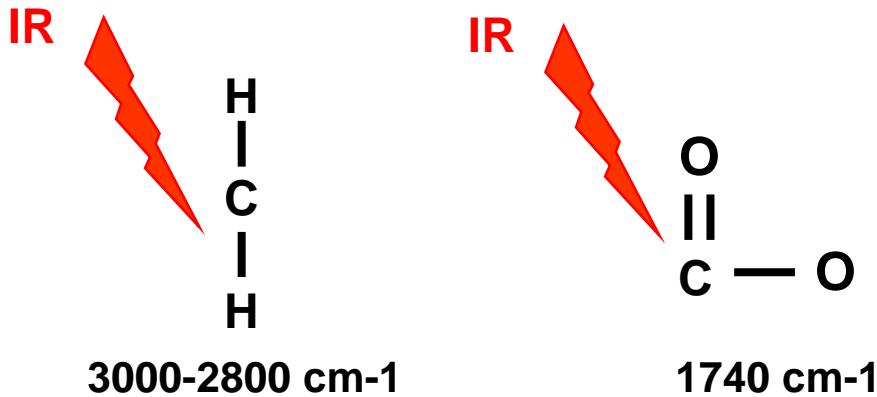

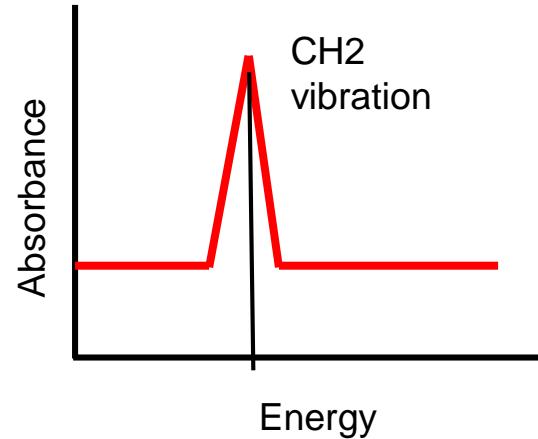

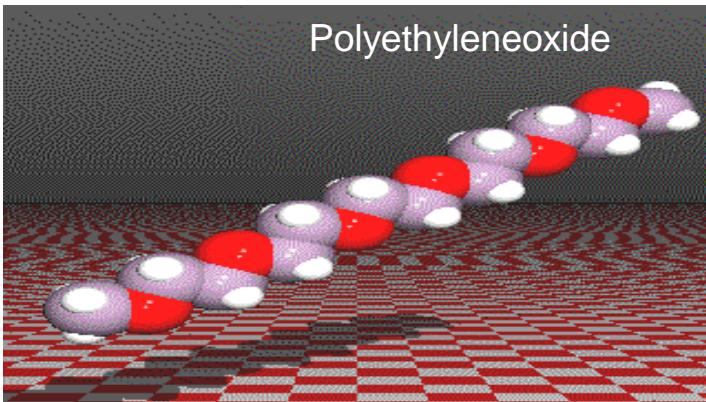

→ A need for a new tool

# The synchrotron SOLEIL

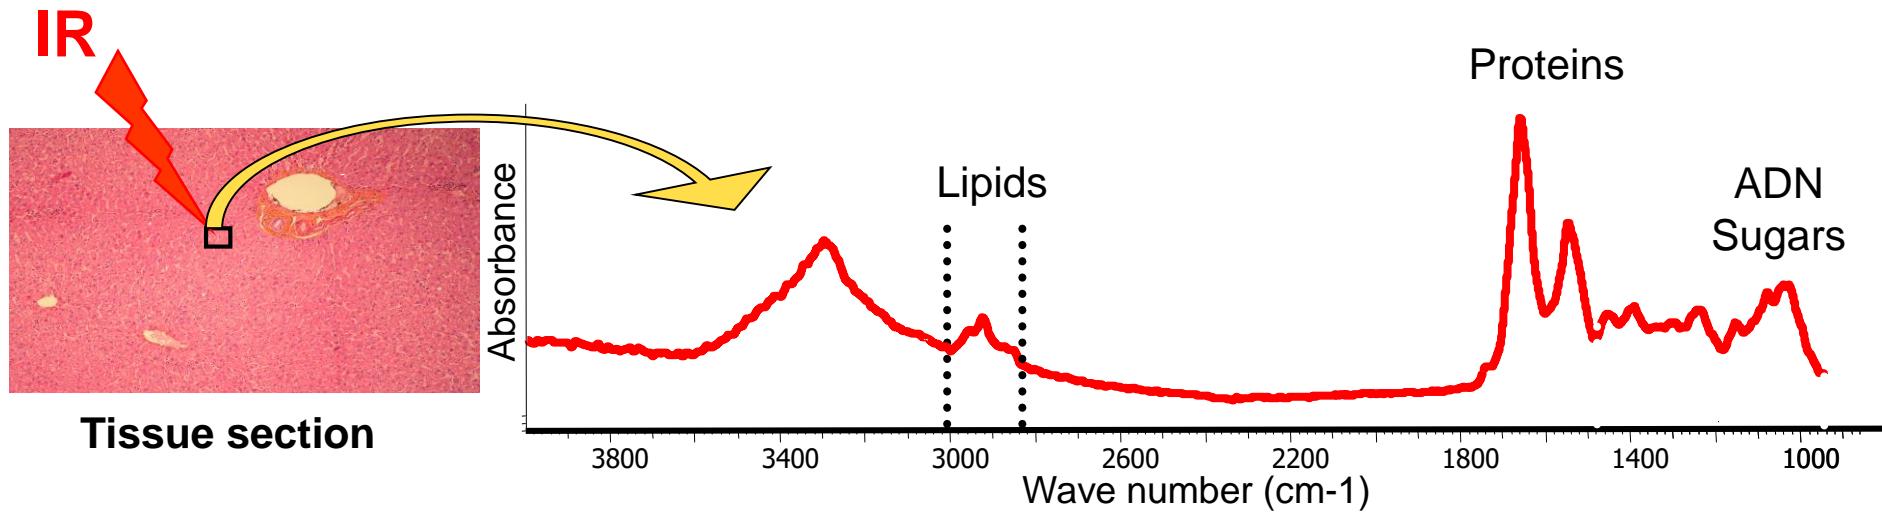

IR UV X

# Infrared spectroscopy

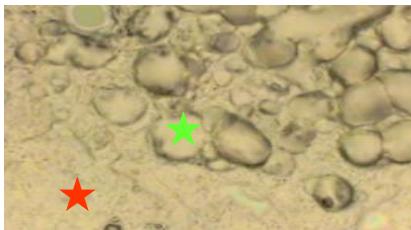

# Infrared spectroscopy on tissues

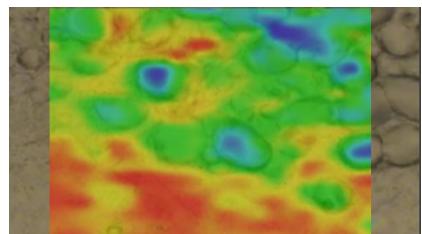

The spectrum is resulting of the global biochemical composition

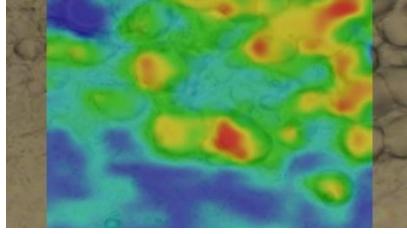

# Infrared microspectroscopy on steatosis

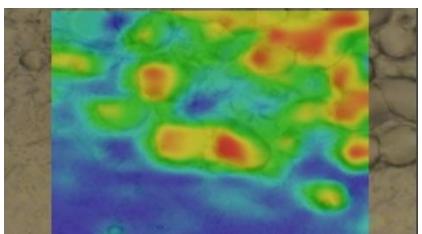

1475-1710 cm<sup>-1</sup> Proteins

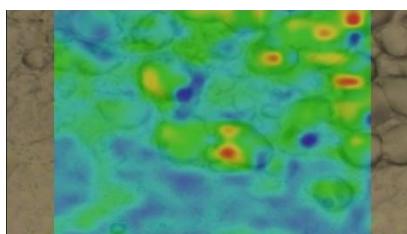

1710-1780 cm<sup>-1</sup> Esters

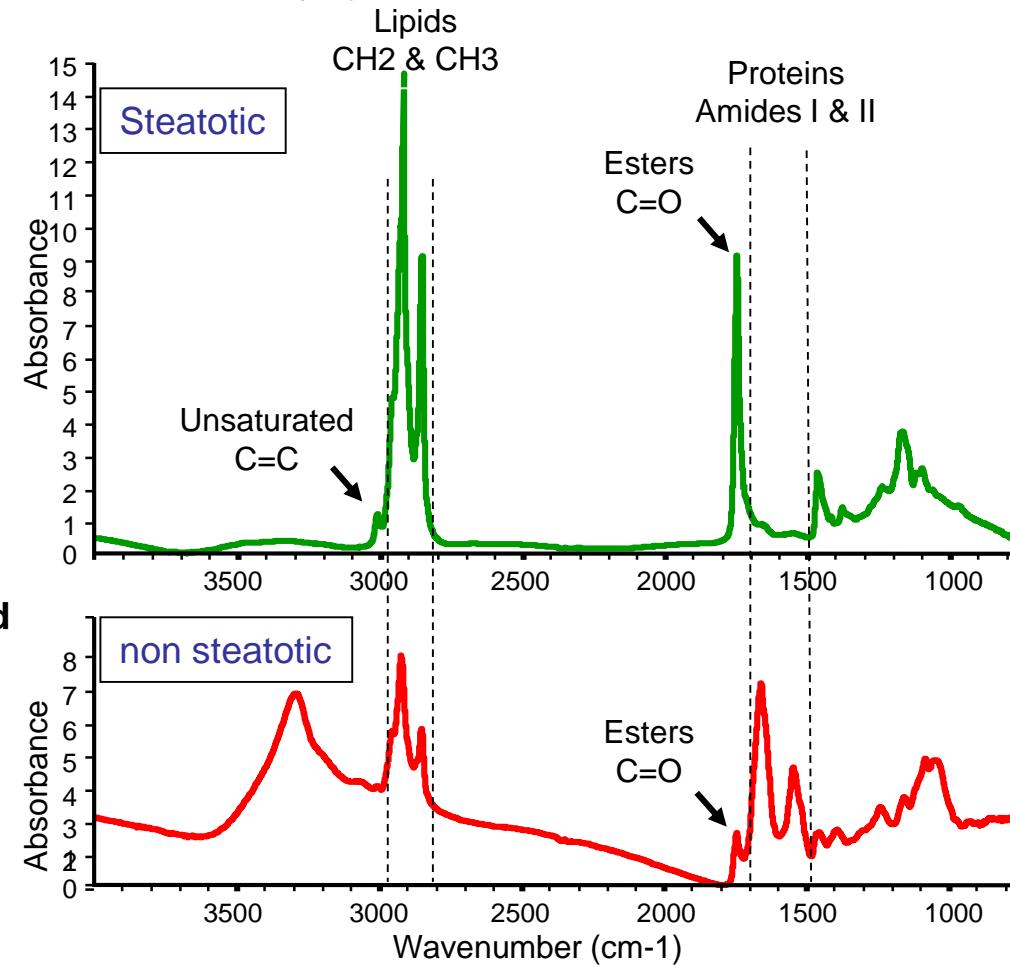

3000-2800 cm<sup>-1</sup> Lipids

3000-3060 cm<sup>-1</sup> Unsaturated

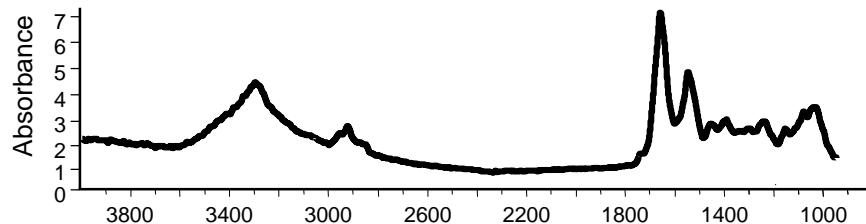

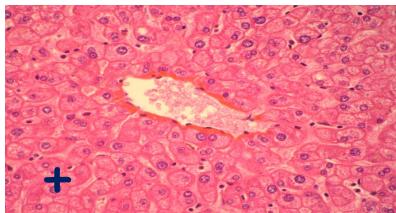

Min Max

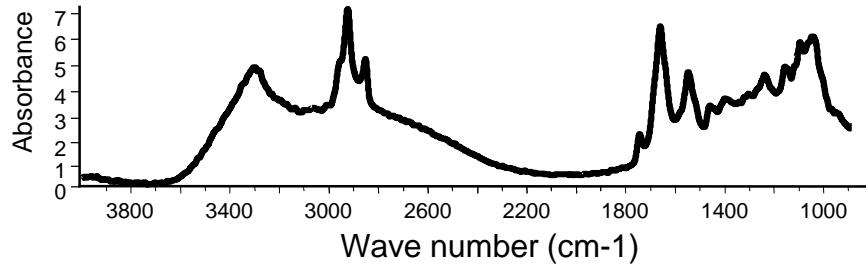

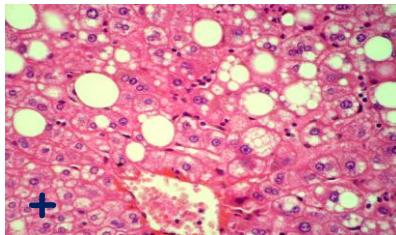

# Analysis of the non-steatotic tissue

Normal liver

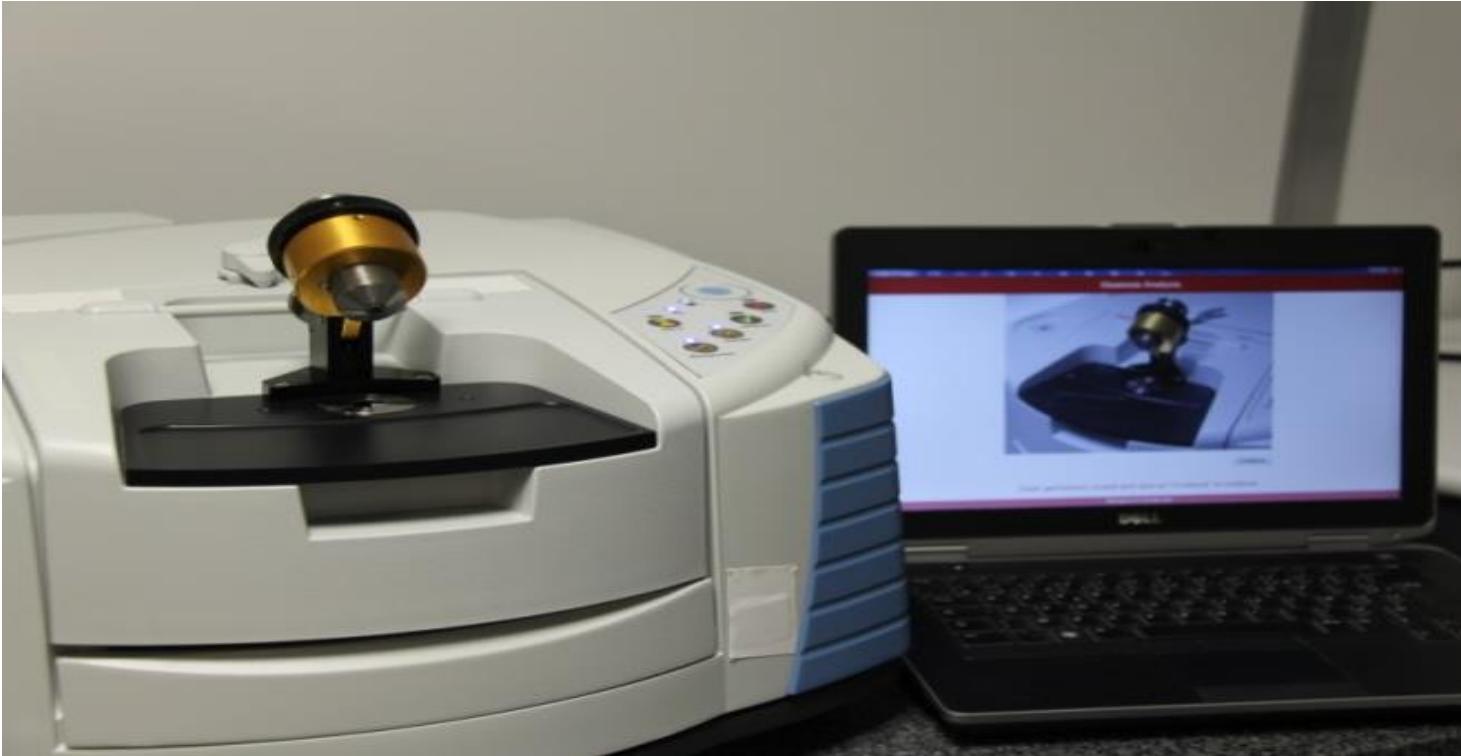

Steatosis

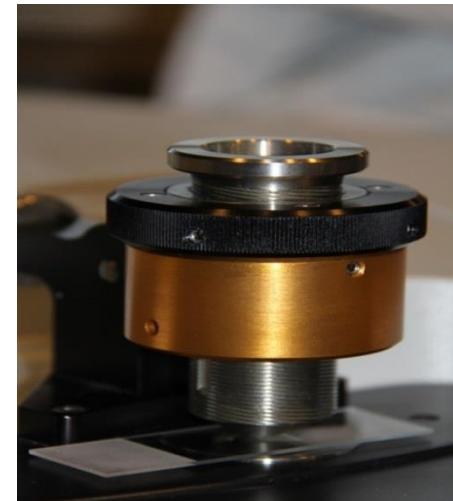

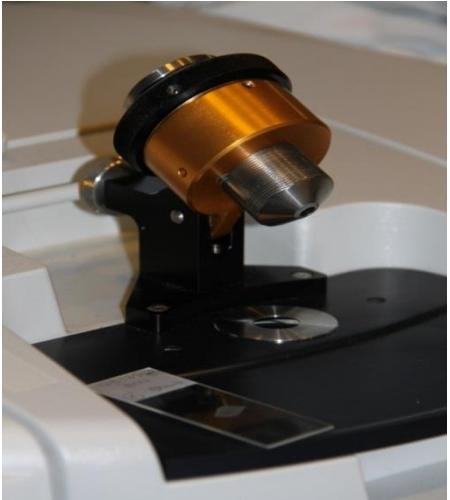

The non-steatotic part of the tissue is NOT normal

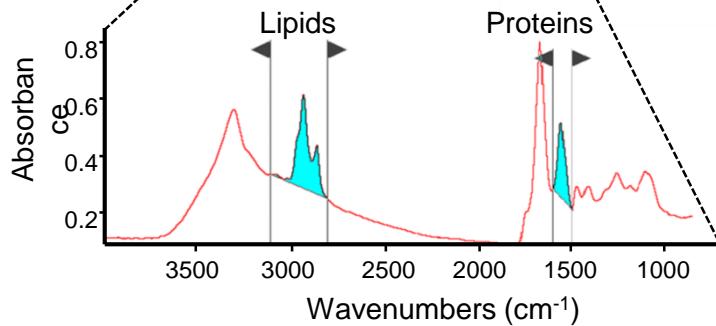

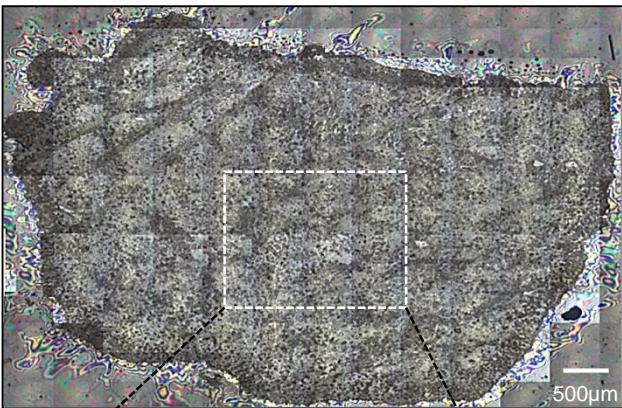

# From synchrotron to the hospital

ATR infrared spectroscopy

# Quantification of steatosis using IR

Pixel 2 mm x 2 mm

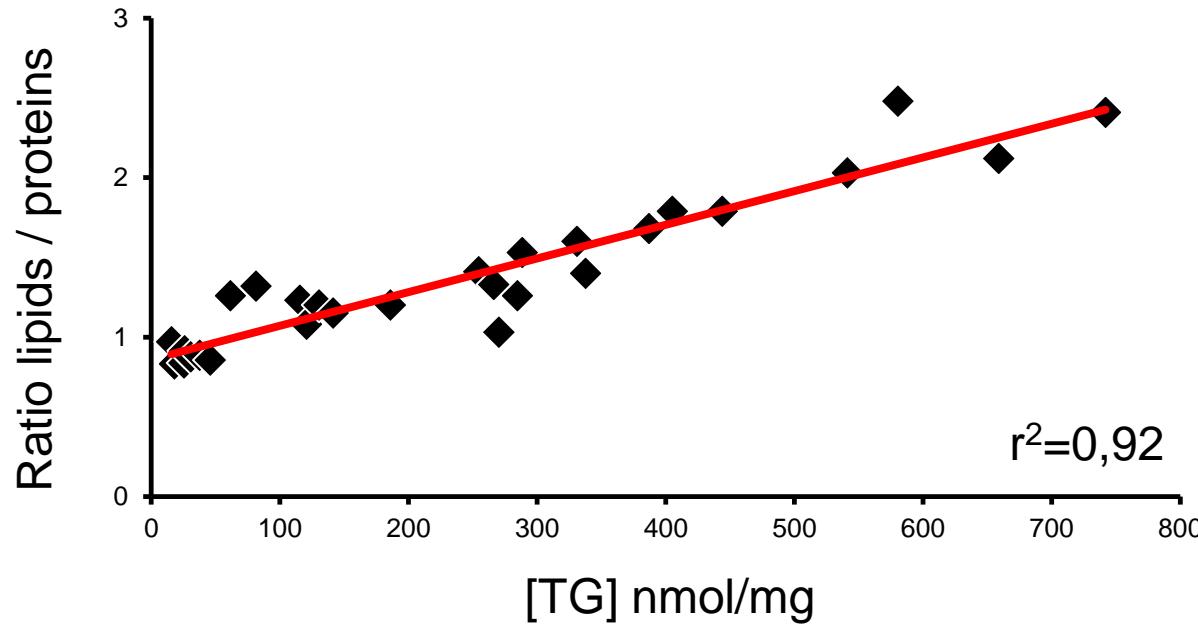

Time acquisition : 1 min

Ratio: lipids / proteins

Estimation of lipids

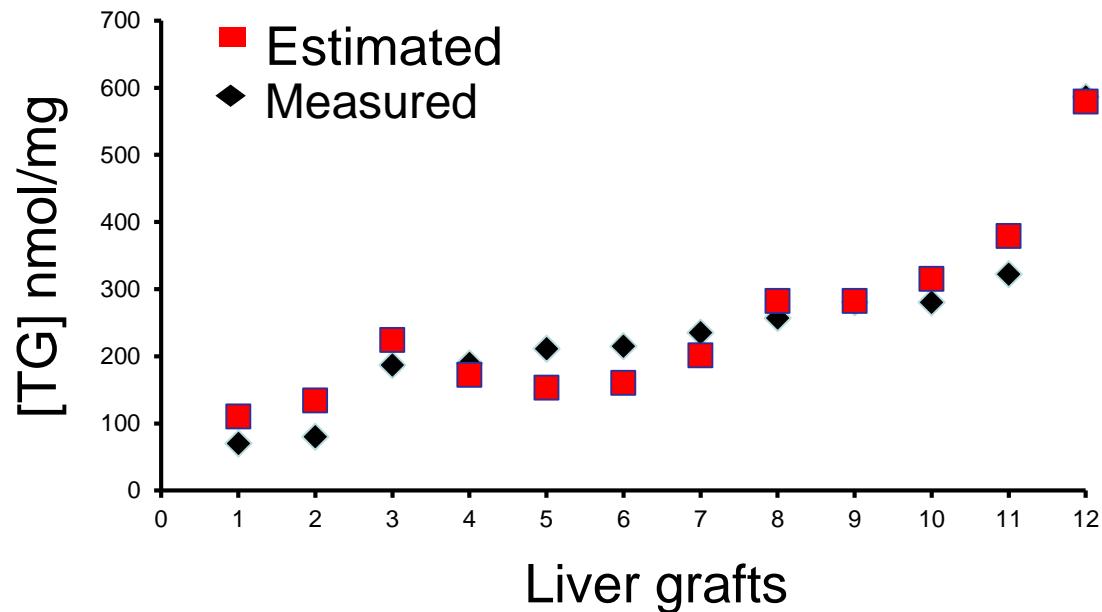

# Quantification of steatosis using IR

25 tissue samples from liver surgical specimens - Steatosis : 5 to 90%

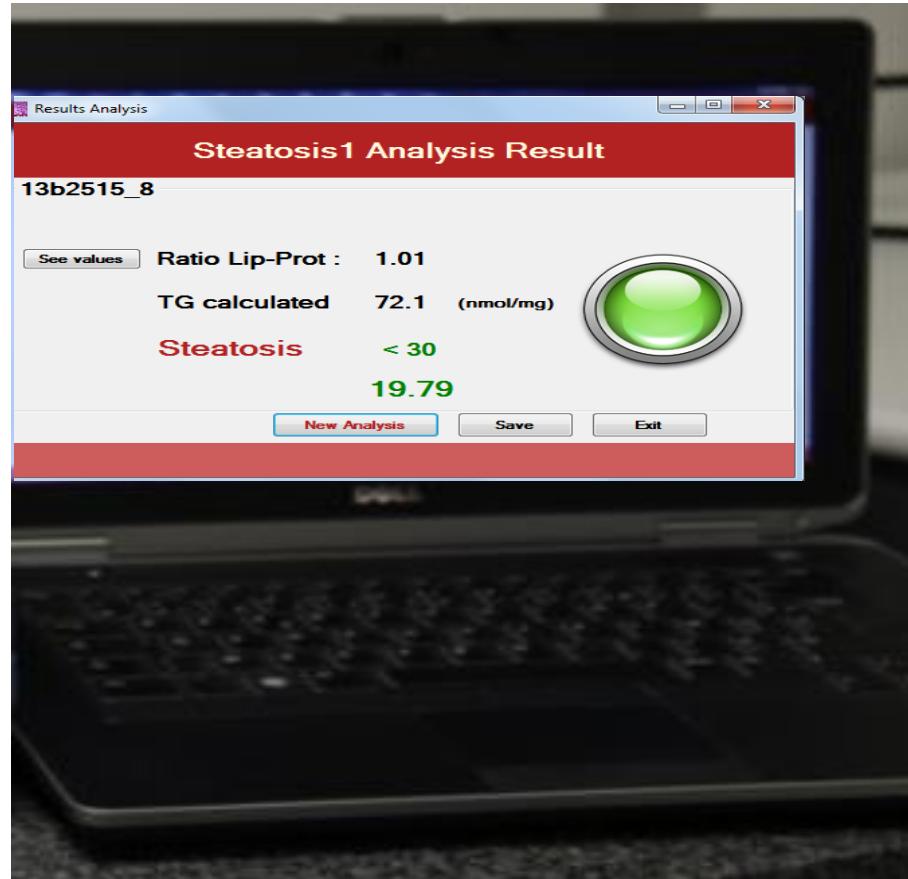

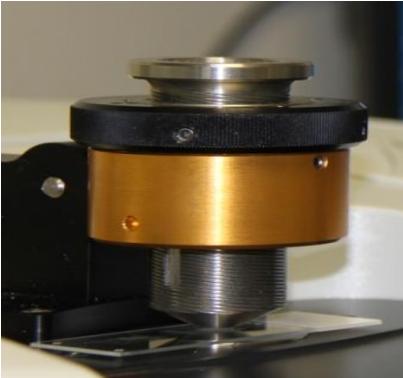

Infrared spectroscopy allows the quantification of lipids on tissue section

# Lipid evaluation by IR microspectroscopy

Validation on additional 21 liver graft biopsies

# Estimation of steatosis on liver graft

# Conclusion

- Quantitative
- Reproducible
- Compatible with clinical practise (frozen sections on glass slides)
- Non destructive
- Non expansive
- Rapid – quantification of steatosis in 1 min!

→ Assessment of liver graft quality
